Sustainable Use Of Genetic Diversity In Forage And Turf Breeding:

Sustainable use of genetic diversity in forage and turf breeding Christian Huyghe, 2010 **Sustainable use of Genetic Diversity in Forage and Turf Breeding** Christian Huyghe, 2010-06-10 Grassland produces feed for livestock improves soil fertility and structure protects water resources and may contribute to climate change mitigation through carbon storage and to biodiversity preservation It simultaneously maintains sustainable economic outputs for farmers and provides ecosystem services Turf similarly considerably contributes to our environment by adding beauty to our surroundings providing a safe playing surface for sports and recreation The species diversity present in most grasslands and turfs is a functional diversity contributing to the previously mentioned agronomic and environmental benefits The species belong to different functional groups and the adequate species composition may maximise the agronomic performance through a higher production and a better quality and the environmental benefits through symbiotic nitrogen fixation or sources of pollen and nectar to pollinators In a given grassland or turf the genetic diversity available in each variety contributes to this economic and environmental performance but also to the stability of these performances including the stability of the resistance against pathogens and pests Natural grasslands share many species with the sown swards They may be regarded as favourable sites for in situ preservation of genetic diversity as well as valuable sources of diversity for breeding *Breeding strategies for sustainable forage and turf grass improvement* Susanne Barth, Dan Milbourn, 2012-07-25 From the 4th 8th of September 2011 the Eucarpia Fodder Crops and Amenity Grasses Section held its 29th Meeting in the surroundings of Dublin Castle in Ireland The theme of the meeting was Breeding strategies for sustainable forage and turf grass improvement Grasslands cover a significant proportion of the land mass of the world and play a pivotal role in global food production At the same time we are faced with several challenges that affect the way in which we think about this valuable set of resources The population of the world is expected to exceed 9 billion by 2050 and increase of about one third relative to today's levels This population increase will be focused in urban areas and in what are currently viewed as developing countries meaning that the buying power of this increased population will be greater shifting the balance of demand from staple crops to high value items such as meat and dairy products Overall that the world will have to approximately double agricultural output across all categories of food to meet the demands of this larger urbanised population This is occurring against a backdrop of equally large challenges in terms of global climate change Agriculture is already a significant contributor to e.g. greenhouse gas emissions deforestation and soil erosion The situation is made more complex by an increased emphasis on biofuels as a solution for our imminent oil shortage resulting in increased competition between land utilised for food and fuel In short agriculture must continue to feed the world whilst not contributing to damaging it further It must be sustainable Plant breeding plays a significant but frequently understated role in meeting the challenges presented by this complex and changing scenario However plant breeding and improvement is itself undergoing radical change driven by technology This book explores how

forage and turf breeding is changing and adapting to meet these challenges using the technological advances being experienced in plant breeding as a whole

Quantitative Traits Breeding for Multifunctional Grasslands and Turf Dejan Sokolović, Christian Huyghe, Jasmina Radović, 2014-09-12 Grasslands are among the largest ecosystems in the world and consequently are of great importance to mankind The genotypes of the species which are the main components of the grasslands have great influence on total outcome and successful utilization of grasslands Therefore fodder crops and turf swards should be constantly improved to follow modern trends in agriculture production and landscape architecture The wide range of breeding programs for forage and amenity species as well as new breeding methods and techniques is rapidly expanding the boundaries and is making it possible to achieve outstanding breeding results This book includes papers presented at the 30th EUCARPIA Fodder Crops and Amenity Grasses Section Meeting The challenging title of the book focuses on breeding of quantitative traits which directly impact the profitability and sustainability of grasslands and fodder crops production as well as on multidisciplinary approach in grassland research and utilisation Included papers offer a unique collection of ideas and breakthroughs in the fields of fodder crops and amenity grasses breeding and genetics as well as in the creative and innovative application of new tools in practical breeding

Genetics, Genomics and Breeding of Forage Crops Hongwei Cai, Toshihiko Yamada, Chittaranjan Kole, 2016-04-19 Forage crops include several species of grasses and legumes that are widely used as animal fodder in the form of hay pasturage and silage as well as for turf and erosion control Some forage grasses are also being considered for bio energy generation In this book leading researchers review the latest advances in molecular genetics and genomics they also examine the success of breeding programs for forage grasses and legume species The book will be useful for students and young researchers with an interest in forage turf and bio energy crops improvements

Breeding in a World of Scarcity Isabel Roldán-Ruiz, Joost Baert, Dirk Reheul, 2016-06-13 This book includes papers presented at the 2015 meeting of the Fodder Crops and Amenity Grasses Section of Eucarpia The theme of the meeting Breeding in a world of scarcity was elaborated in four sessions 1 scarcity of natural resources 2 scarcity of breeders 3 scarcity of land and 4 scarcity of focus Parts I to IV of this book correspond to these four sessions Session 1 refers to the consequences of climate change reduced access to natural resources and declining freedom in using them Plant breeding may help by developing varieties with a more efficient use of water and nutrients and a better tolerance to biotic and abiotic stresses Session 2 refers to the

shrinking number of field breeders There is a need for a mutual empathy between field and lab oriented breeding activities integrating new methods of phenotyping and genotyping Session 3 underscores the optimal use of agricultural land Forage needs to be intensively produced in a sustainable way meeting the energy protein and health requirements of livestock Well adapted varieties species and mixtures of grasses and legumes are needed Session 4 refers to the fading of focus in primary production triggered by a range of societal demands There are few farmers left and they are asked to meet many consumer demands Both large scale multi purpose species and varieties and specialized niche crops are required Part V summarizes the conclusions of two open debates two working group meetings and two workshops held during the conference The debates were devoted to the future of grass and fodder crop breeding and to feed quality breeding and testing The conference hosted meetings of the working groups Multisite rust evaluation and Festulolium Workshops focused on genomic selection and association mapping and on phenotyping with applications in practical breeding research Part V contains also short sketches of breeding ideas presented as short communications
