Chemical Sensors Guillermo Orellana,Maria Cruz Moreno-Bondi,2006-01-27 With their similarity to the organs of the most advanced creatures that inhabit the Earth sensors are regarded as being the senses of electronics artificial eyes and ears that are capable of seeing and hearing beyond the range of man perception electronic noses and tongues that can recognise odours and flavours without a lifetime training touch that is able not only to feel the texture and temperature of the materials but even to discern their chemical composition Among the world of chemical sensors optical devices sometimes termed optodes from the Greek the optical way have reached a prominent place in those areas where the features of light and of the

light matter interaction show their advantage contactless or long distance interrogation detection sensitivity analyte selectivity absence of electrical interference or risks and lack of analyte consumption to name just a few The introduction of optical fibres and integrated optics has added more value to such sensing since now light can be confined and readily carried to difficult to reach locations higher information density can be transported indicator dyes can be immobilised at the distal end or the evanescent field for unique chemical and biochemical sensing including multiplexed and distributed measurements optical sensors can now be subject to mass production and novel sensing schemes have been established interferometric surface plasmon resonance fluorescence energy transfer supramolecular recognition

The Nucleon-nucleon Interaction and the Nuclear Many-body Problem Gerald E. Brown, Jeremy William Holt, Thomas Tzu Szu Kuo, 2010 This book provides a comprehensive overview of some key developments in the understanding of the nucleon nucleon interaction and nuclear many body theory The main problems at the level of meson exchange physics have been solved and we have an effective field theory using a phenomenological interaction pioneered by Achim Schwenk and Scott Bogner which is nearly universally accepted as a unique low momentum interaction that includes all experimental data to date This understanding is based on a multi step development in which different scientific insights and a wide range of physical and mathematical methodologies fed into each other It is best appreciated by looking at the different steps along the way starting with the pioneering work of Brueckner and his collaborators that was just as necessary and important as the insightful masterly improvements to Brueckner's theory by Hans Bethe and his students Moving on from there the off shell effects that bedeviled Bethe's work which had resulted in the 1963 Reference Spectrum Method were treated relatively accurately by introducing an energy gap between initial bound states and an intermediate state With their influential 1967 paper Brown and Kuo prepared the effective field theory Later the introduction of Brown Rho scaling deepened understanding of saturation in the many body system and fed directly into recent work on carbon 14 dating [Efoe/lan 86](#) Danae Fasano, Chris Kennelly, Paul Polishuk,
