Islam Victor J. Katz, Annette Imhausen, 2007-08-05 In recent decades it has become obvious that mathematics has always been a worldwide activity But this is the first book to provide a substantial collection of English translations of key mathematical texts from the five most important ancient and medieval non Western mathematical cultures and to put them into full historical and mathematical context The Mathematics of Egypt Mesopotamia China India and Islam gives English readers a firsthand understanding and appreciation of these cultures important contributions to world mathematics The five section authors Annette Imhausen Egypt Eleanor Robson Mesopotamia Joseph Dauben China Kim Plofker India and J Lennart Berggren Islam are experts in their fields Each author has selected key texts and in many cases provided new translations The authors have also written substantial section introductions that give an overview of each mathematical culture and explanatory notes that put each selection into context This authoritative commentary allows readers to understand the sometimes unfamiliar mathematics of these civilizations and the purpose and significance of each text Addressing a critical gap in the mathematics literature in English this book is an essential resource for anyone with at least an undergraduate degree in mathematics who wants to learn about non Western mathematical developments and how they helped shape and enrich world mathematics The book is also an indispensable guide for mathematics teachers who want to use non Western mathematical ideas in the classroom

Geometry: Euclid and Beyond Robin Hartshorne, 2013-11-11 In recent years I have been teaching a junior senior level course on the classical geometries This book has grown out of that teaching experience I assume only high school geometry and some abstract algebra The course begins in Chapter 1 with a critical examination of Euclid's Elements Students are expected to read concurrently Books I IV of Euclid's text which must be obtained separately The remainder of the book is an exploration of questions that arise naturally from this reading together with their modern answers To shore up the foundations we use Hilbert's axioms The Cartesian plane over a field provides an analytic model of the theory and conversely we see that one can introduce coordinates into an abstract geometry The theory of area is analyzed by cutting figures into triangles The algebra of field extensions provides a method for deciding which geometrical constructions are possible The investigation of the parallel postulate leads to the various non Euclidean geometries And in the last chapter we provide what is missing from Euclid's treatment of the five Platonic solids in Book XIII of the Elements For a one semester course such as I teach Chapters 1 and 2 form the core material which takes six to eight weeks
