Advanced Dynamics of Rolling Elements P.K. Gupta,2012-12-06 In any rotating machinery system the bearing has traditionally been a critical member of the entire system since it is the component that permits the relative motion between the stationary and moving parts Depending on the application a number of different bearing types have been used such as oil lubricated hydrodynamic bearings gas bearings magnetic suspensions rolling element bearings etc Hydrodynamic bearings can provide any desired load support but they are limited in stiffness and the associated power loss may be quite large Gas bearings are used for high precision applications where the supported loads are relatively light bearing power losses are very low and the rotating speeds generally high For super precision components where no frictional dissipation or bearing power loss can be tolerated magnetic suspensions are employed again the load support requirements are very low Rolling element bearings have been widely used for those applications that require greater bearing versatility due to the requirements for high load and high stiffness characteristics while allowing moderate power loss and permitting variable speeds A study of the dynamic interaction of rolling elements is therefore the subject of this text Texts covering the analysis and design methodology of rolling elements are very limited Notable works include Analysis of Stresses and Deflections Jones 1946 Vols I and II Ball and Roller Bearings Their Theory Design and Application Eschmann Hasbargen and Weigand 1958 Ball and Roller Bearing Engineering Palmgren 1959 3rd ed Advanced Bearing Technology Bisson and

Evaluation of Dynamic Systems Excited in Time Domain - Redset Achintya Haldar, Hamoon Azisoltani, J. Ramon
Gaxiola-Camacho, Sayyed Mohsen Vazirizade, Jungwon Huh, 2023-03-21 RELIABILITY EVALUATION OF DYNAMIC SYSTEMS
EXCITED IN TIME DOMAIN REDSET Multi disciplinary approach to structural reliability analysis for dynamic loadings
offering a practical alternative to the random vibration theory and simulation Reliability Evaluation of Dynamic Systems
Excited in Time Domain REDSET is a multidisciplinary concept that enables readers to estimate the underlying risk that
could not be solved in the past The major hurdle was that the required limit state functions LSFs are implicit in nature and
the lack of progress in the reliability evaluation methods for this class of problems The most sophisticated deterministic
analysis requires that the dynamic loadings must be applied in the time domain To satisfy these requirements REDSET is
developed Different types and forms of dynamic loadings including seismic wind induced wave and thermomechanical
loading in the form of heating and cooling of solder balls used in computer chips are considered to validate REDSET Time
domain representations and the uncertainty quantification procedures including the use of multiple time histories are
proposed and demonstrated for all these dynamic loadings Both onshore and offshore structures are used for validation The
potential of REDSET is demonstrated for implementing the Performance Based Seismic Design PBSDB concept now under
development in the United States For wider multidisciplinary applications structures are represented by finite elements to

capture different types of nonlinearity more appropriately Any computer program capable of conducting nonlinear time domain dynamic analysis can be used and the underlying risk can be estimated with the help of several dozens or hundreds of deterministic finite element analyses providing an alternative to the simulation approach To aid comprehension of REDSET numerous illustrative examples and solution strategies are presented in each chapter Written by award winning thought leaders from academia and professional practice the following sample topics are included Fundamentals of reliability assessment including set theory modeling of uncertainty the risk based engineering design concept and the evolution of reliability assessment methods Implicit performance or limit state functions are expressed explicitly by the extensively modified response surface method with several new experimental designs Uncertainty quantification procedures with multiple time histories for different dynamic loadings illustrated with examples The underlying risk can be estimated using any computer program representing structures by finite elements with only few deterministic analyses REDSET is demonstrated to be an alternative to the classical random vibration concept and the basic simulation procedure for risk estimation purposes REDSET changes the current engineering design paradigm Instead of conducting one deterministic analysis a design can be made more dynamic load tolerant resilient and sustainable with the help of a few additional deterministic analyses This book describing REDSET is expected to complement two other books published by Wiley and authored by Halder and Mahadevan Probability Reliability and Statistical Methods in Engineering Design and Reliability Assessment Using Stochastic Finite Element Analysis The book is perfect to use as a supplementary resource for upper level undergraduate and graduate level courses on reliability and risk based design

Perturbation Analysis of Discrete Event Dynamic Systems Yu-Chi (Larry) Ho, Xi-Ren Cao, 2012-12-06 Dynamic Systems DEDS are almost endless military C3I Ilogistic systems the emergency ward of a metropolitan hospital back offices of large insurance and brokerage firms service and spare part operations of multinational firms the point is the pervasive nature of such systems in the daily life of human beings Yet DEDS is a relatively new phenomenon in dynamic systems studies From the days of Galileo to Newton to quantum mechanics and cosmology of the present dynamic systems in nature are primarily differential equations based and time driven A large literature and endless success stories have been built up on such Continuous Variable Dynamic Systems CVDS It is however equally clear that DEDS are fundamentally different from CVDS They are event driven asynchronous mostly man made and only became significant during the past generation Increasingly however it can be argued that in the modern world our lives are being impacted by and dependent upon the efficient operations of such DEDS Yet compared to the successful paradigm of differential equations for CVDS the mathematical modelling of DEDS is in its infancy Nor are there as many successful and established techniques for their analysis and synthesis The purpose of this series is to promote the study and understanding of the modelling analysis control and management of DEDS The idea of the series came from editing a special issue of the Proceedings of IEEE on DEOS during 1988
