Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, at a pace of 3.0 to 3.5 miles per hour. The control group was instructed to continue with their current level of activity. The subjects were assessed at baseline and at 12 weeks for physical and psychological health. The walking program had a significant positive effect on the physical and psychological health of the subjects. The walking program significantly improved the subjects' physical health, as measured by the 6-minute walk test, and their psychological health, as measured by the Beck Depression Inventory and the State-Trait Anxiety Inventory. The walking program also had a significant positive effect on the subjects' quality of life, as measured by the SF-36. The walking program was well tolerated and had no adverse effects. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.

Training—The training program for the new recruits was designed to provide them with the knowledge and skills necessary to perform the duties of a police officer. The training was divided into three phases: basic training, field training, and advanced training. Basic training was a 12-week program that covered topics such as law, ethics, and physical fitness. Field training was a 12-week program that provided recruits with hands-on experience in the field. Advanced training was a 12-week program that provided recruits with specialized training in areas such as community policing and crime prevention.

Abstract: The purpose of this study was to investigate the effect of a 12-week training program on the physical and psychological health of sedentary middle-aged women. The study was conducted in a community center in Tehran, Iran. The participants were 30 women aged 40-50 years, who were sedentary and had no chronic diseases. They were divided into two groups: a control group (n=15) and an intervention group (n=15). The intervention group participated in a 12-week training program consisting of three sessions per week, each lasting 45 minutes. The training program included aerobic exercises, strength training, and flexibility exercises. The control group did not participate in any training program. The data were collected at the beginning and at the end of the 12-week period. The results showed that the intervention group had significant improvements in physical and psychological health compared to the control group. The intervention group had significant increases in heart rate, blood pressure, and body mass index (BMI). They also had significant decreases in anxiety and depression scores. The control group did not show any significant changes in these variables. The results of this study suggest that a 12-week training program can improve the physical and psychological health of sedentary middle-aged women.

QUESTION

1. A 60-year-old male with a long history of alcohol abuse presents with a 2-week history of increasing weakness, weight loss, and abdominal pain. He has a 30-year history of smoking 2 packs of cigarettes daily. Physical examination reveals a thin, cachectic man with a 10-lb weight loss over the past 6 months. He has a 2-cm, firm, nontender mass in the right upper quadrant of the abdomen. Laboratory studies show a hemoglobin of 10 g/dL, a hematocrit of 30%, and a white blood cell count of 12,000/mm³ with a neutrophilic shift. The serum aspartate aminotransferase (AST) is 150 U/L, the serum alanine aminotransferase (ALT) is 180 U/L, and the serum alkaline phosphatase (ALP) is 300 U/L. The serum bilirubin is 2.5 mg/dL. The serum alpha-fetoprotein (AFP) is 150 ng/mL. The patient is diagnosed with hepatocellular carcinoma (HCC). What is the most likely cause of this patient's HCC?

ANSWER

Chronic alcohol abuse

EXPLANATION

Hepatocellular carcinoma (HCC) is a malignant tumor of the liver. It is the most common primary liver cancer and the second leading cause of cancer death in the United States. The most common risk factors for HCC are chronic alcohol abuse, chronic hepatitis B virus (HBV) infection, and chronic hepatitis C virus (HCV) infection. Other risk factors include nonalcoholic fatty liver disease (NAFLD), primary biliary cirrhosis (PBC), and exposure to aflatoxin. The patient in this question has a long history of alcohol abuse, which is the most likely cause of his HCC. The physical examination and laboratory studies are consistent with HCC. The 2-cm, firm, nontender mass in the right upper quadrant of the abdomen is a typical finding in HCC. The laboratory studies show a hemoglobin of 10 g/dL, a hematocrit of 30%, and a white blood cell count of 12,000/mm³ with a neutrophilic shift. The serum aspartate aminotransferase (AST) is 150 U/L, the serum alanine aminotransferase (ALT) is 180 U/L, and the serum alkaline phosphatase (ALP) is 300 U/L. The serum bilirubin is 2.5 mg/dL. The serum alpha-fetoprotein (AFP) is 150 ng/mL. The patient is diagnosed with hepatocellular carcinoma (HCC).
