 relatively new computational tool aimed at problems involving static and or dynamic behaviour of systems involving a large
 number of solid deformable bodies Such problems include fragmentation using explosives e g rock blasting impacts
 demolition collapsing buildings blast loads digging and loading processes and powder technology The combined finite
 discrete element method a natural extension of both discrete and finite element methods allows researchers to model
 problems involving the deformability of either one solid body a large number of bodies or a solid body which fragments e g in
 rock blasting applications a more or less intact rock mass is transformed into a pile of solid rock fragments of different sizes
 which interact with each other The topic is gaining in importance and is at the forefront of some of the current efforts in
 computational modeling of the failure of solids Accompanying source codes plus input and output files available on the
