Fraenkel-Conrat, 2013-04-17 The time seems ripe for a critical compendium of that segment of the biological universe we call viruses Virology as a science having passed only recently through its descriptive phase of naming and numbering has probably reached that stage at which relatively few new truly new viruses will be discovered Triggered by the intellectual probes and techniques of molecular biology genetics biochemical cytology and high resolution microscopy and spectroscopy the field has experienced a genuine information explosion Few serious attempts have been made to chronicle these events This comprehensive series which will comprise some 6000 pages in a total of about 22 volumes represents a commitment by a large group of active investigators to analyze digest and expostulate on the great mass of data relating to viruses much of which is now amorphous and disjointed and scattered throughout a wide literature In this way we hope to place the entire field in perspective and to develop an invaluable reference and sourcebook for researchers and students at all levels This series is designed as a continuum that can be entered anywhere but which also provides a logical progression of developing facts and integrated concepts **Stress and Environmental Regulation of Gene Expression and Adaptation in**

Bacteria, 2 Volume Set Frans J. de Bruijn, 2016-09-06 Bacteria in various habitats are subject to continuously changing environmental conditions such as nutrient deprivation heat and cold stress UV radiation oxidative stress dessication acid stress nitrosative stress cell envelope stress heavy metal exposure osmotic stress and others In order to survive they have to respond to these conditions by adapting their physiology through sometimes drastic changes in gene expression In addition

they may adapt by changing their morphology forming biofilms fruiting bodies or spores filaments Viable But Not Culturable VBNC cells or moving away from stress compounds via chemotaxis Changes in gene expression constitute the main component of the bacterial response to stress and environmental changes and involve a myriad of different mechanisms including alternative sigma factors bi or tri component regulatory systems small non coding RNA s chaperones CHRIS Cas systems DNA repair toxin antitoxin systems the stringent response efflux pumps alarmones and modulation of the cell envelope or membranes to name a few Many regulatory elements are conserved in different bacteria however there are endless variations on the theme and novel elements of gene regulation in bacteria inhabiting particular environments are constantly being discovered Especially in pathogenic bacteria colonizing the human body a plethora of bacterial responses to innate stresses such as pH reactive nitrogen and oxygen species and antibiotic stress are being described An attempt is made to not only cover model systems but give a broad overview of the stress responsive regulatory systems in a variety of bacteria including medically important bacteria where elucidation of certain aspects of these systems could lead to treatment strategies of the pathogens Many of the regulatory systems being uncovered are specific but there is also considerable cross talk between different circuits Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria is a comprehensive two volume work bringing together both review and original research articles on key topics in stress and environmental control of gene expression in bacteria Volume One contains key overview chapters as well as content on one two three component regulatory systems and stress responses sigma factors and stress responses small non coding RNAs and stress responses toxin antitoxin systems and stress responses stringent response to stress responses to UV irradiation SOS and double stranded systems repair systems and stress adaptation to both oxidative and osmotic stress and desiccation tolerance and drought stress Volume Two covers heat shock responses chaperonins and stress cold shock responses adaptation to acid stress nitrosative stress and envelope stress as well as iron homeostasis metal resistance quorum sensing chemotaxis and biofilm formation and viable but not culturable VBNC cells Covering the full breadth of current stress and environmental control of gene expression studies and expanding it towards future advances in the field these two volumes are a one stop reference for non medical molecular geneticists interested in gene regulation under stress

Multi-omics strategies for detecting gene-environment interactions Patrick Deelen, 2019-05-06 Our DNA 3 billion letters long is the blueprint of life People differ from each other in around 1% of these letters However it is largely unknown which of these differences cause disease nor how exactly changes in DNA ultimately lead to disease In my PhD research I contributed to the detection of these genetic risk factors and studied how these DNA changes actually disrupt the correct functioning of cells Using the Genome of the Netherlands project results in which the BBMRI NL consortium fully mapped the DNA of 250 Dutch families I was able to improve genetic research in other groups of people and thereby better detect genetic risk factors I then looked at how these DNA changes disrupt individual cells in a large number of people participating in various Dutch bio

banks such as Lifelines By looking at DNA RNA epigenetics and proteins at the same time I was able to discover many genetic risk factors which biological processes they disrupt and which ones offer starting points for the development of new medicines that can repair these disrupted processes In addition through the large scale re use of RNA data I was able to map how many genes relate together and to disease With these big data analyses I subsequently developed a new algorithm that is now being used to make a diagnosis more quickly in people with a serious illness With my PhD research I contributed to the immediate improvement of patient care and collected new knowledge that could help in the longer term with the development of new medicines

DNA Microarrays and Gene Expression Pierre Baldi, G. Wesley Hatfield, 2011-04-28 Massive data acquisition technologies such as genome sequencing

high throughput drug screening and DNA arrays are in the process of revolutionizing biology and medicine Using the mRNA of a given cell at a given time under a given set of conditions DNA microarrays can provide a snapshot of the level of expression of all the genes in the cell Such snapshots can be used to study fundamental biological phenomena such as development or evolution to determine the function of new genes to infer the role individual genes or groups of genes may play in diseases and to monitor the effect of drugs and other compounds on gene expression Originally published in 2002 this interdisciplinary introduction to DNA arrays will be of value to anyone with an interest in this powerful technology
