Parabolic Geometries I Andreas Čap,Jan Slovák,2024-07-29 Parabolic geometries encompass a very diverse class of geometric structures including such important examples as conformal projective and almost quaternionic structures hypersurface type CR structures and various types of generic distributions The characteristic feature of parabolic geometries is an equivalent description by a Cartan geometry modeled on a generalized flag manifold the quotient of a semisimple Lie group by a parabolic subgroup Background on differential geometry with a view towards Cartan connections and on semisimple Lie algebras and their representations which play a crucial role in the theory is collected in two introductory chapters The main part discusses the equivalence between Cartan connections and underlying structures including a complete proof of Kostant's version of the Bott Borel Weil theorem which is used as an important tool For many examples the complete description of the geometry and its basic invariants is worked out in detail The constructions of correspondence spaces and twistor spaces and analogs of the Fefferman construction are presented both in general and in several examples The last chapter studies Weyl structures which provide classes of distinguished connections as well as an equivalent description of the Cartan connection in terms of data associated to the underlying geometry Several applications are discussed throughout the text **Handbook on the Toxicology of Metals: Volume I: General Considerations** Gunnar F. Generators and Relations in Groups and Geometries A. Barlotti, E.W. Ellers, P. Plaumann, K. Strambach, 2012-12-06 Every group is represented in many ways as an epimorphic image of a free group It seems therefore futile to search for methods involving generators and relations which can be used to detect the structure of a group Nevertheless results in the indicated direction exist The clue is to ask the right question Classical geometry is a typical example in which the factorization of a motion into reflections or more generally of a collineation into central collineations supplies valuable information on the geometric and algebraic structure This mode of investigation has gained momentum since the end of last century The tradition of geometric algebraic interplay brought forward two branches of research which are documented in Parts I and II of these Proceedings Part II deals with the theory of reflection geometry which culminated in Bachmann's work where the geometric information is encoded in properties of the group of motions expressed by relations in the generating involutions This approach is the backbone of the classification of motion groups for the classical unitary and orthogonal planes The axioms in this characterization are natural and plausible They provoke the study of consequences of subsets of axioms which also yield natural geometries whose exploration is rewarding Bachmann's central axiom is the three reflection theorem showing that the number of reflections needed to express a motion is of great importance
