What is SDCC?

SDCC is a **retargettable, optimizing ANSI-C compiler suite** that targets the **8051 MCS51** based microprocessors (**8031, 8032, 8051, 8052, etc.**), **Maxim** (formerly **Dallas**) **D580C390** variants, **Freescale** (formerly **Motorola**) **HC08** based (**HC08, s08**) and **Z80** based MCUs (**z80, z180, gbz80, Rabbit 2000/3000, Rabbit 3000A**). Work is in progress on supporting the **Microchip PIC16** and **PIC18** targets. It can be retargeted for other microprocessors.

SDCC suite is a collection of several components derived from different sources with different FOSS licenses.

SDCC compiler suite include:

- **sdas** and **sdld**, a retargettable assembler and linker, based on **ASIXXXX**, written by Alan Baldwin; (GPL).
- **sdcpp** preprocessor, based on **GCC cpp**; (GPL).
- **ucsim** simulators, originally written by Daniel Drotos; (GPL).
- **sdcdb** source level debugger, originally written by Sandeep Dutta; (GPL).
- **sdbinutils** library archive utilities, including **sdc ar**, **sdc nm** and **sdc nm**, derived from GNU Binutils; (GPL).
- **SDCC run-time libraries**; (GPL+LE). Pic device libraries and header files are derived from Microchip header (.inc) and linker script (.ld) files. Microchip requires that "The header files should state that they are only to be used with authentic Microchip devices" which makes them incompatible with the GPL.
- **gcc-test** regression tests, derived from **gcc-testsuite**; (no license explicitly specified, but since it is a part of GCC is probably GPL licensed)
- **packihx**; (public domain)
- **makebin**; (zlib/zlibpng license)
- **sdcc** C compiler, originally written by Sandeep Dutta; (GPL). Some of the features include:
 - extensive MCU specific language extensions, allowing effective use of the underlying hardware.
 - a host of standard optimizations such as global sub-expression elimination, loop optimizations (loop invariant, strength reduction of induction variables and loop reversing), constant folding and propagation, copy propagation, dead code elimination and jump tables for 'switch' statements.
 - MCU specific optimizations, including a global register allocator.
 - adaptable MCU specific backend that should be well suited for other 8 bit MCUs
 - independent rule based peep hole optimizer.
 - a full range of data types: **char** (8 bits, 1 byte), **short** (16 bits, 2 bytes), **int** (16 bits, 2 bytes), **long** (32 bit, 4 bytes), **float** (4 byte IEEE) and **_float/float**; basic (no integer constants) support for **long long** (64 bit, 8 bytes) data types for the z80, z180, r2k, r3ka, gbz80, hc08 and s08 targets.
 - the ability to add inline assembler code anywhere in a function.
 - the ability to report on the complexity of a function to help decide what should be re-written in assembler.
 - a good selection of automated regression tests.

SDCC was written by Sandeep Dutta and released under a **GPL** license. Since its initial release there have been numerous bug fixes and improvements. As of December 1999, the code was moved to SourceForge where all the "users turned developers" can access the same source tree. SDCC is constantly being updated with all the users' and developers' input.
