 Christian Müller-Schloer, Theo Ungerer, Bernhard Bauer, 2004-02-12 Where is system architecture heading The special interest group on Computer and Systems Architecture Fachausschuss Rechner und Systemarchitektur of the German computer and information technology associations GI and ITG addressed this question and discussed it during two Future Workshops in 2002 The result is a nutshell Everything will change but everything else will remain Future systems technologies will build on a mature basis of silicon and IC technology on well understood programming languages and software engineering techniques and on well established operating systems and

middleware concepts Newer and still exotic but exciting technologies like quantum computing and DNA processing are to be watched closely but they will not be mainstream in the next decade Although there will be considerable progress in these basic technologies is there any major trend which unifies these diverse developments There is a common denominator according to the result of the two future Workshops which marks a new quality The challenge for future systems technologies lies in the mastering of complexity Rigid and inflexible systems built under a strict top down regime have reached the limits of manageable complexity as has become obvious by the recent failure of several large scale projects Nature is the most complex system we know and she has solved the problem somehow We just haven't understood exactly how nature does it But it is clear that systems designed by nature like an anthill or a beehive or a swarm of birds or a city are different from today's technical systems that have been designed by engineers and computer scientists

more critical now than ever before Traditional management approaches hide cost effective high latency media HLM storage such as tape or optical disk archive back ends underneath a traditional file system The lack of HLM aware file system interfaces and software makes it difficult for users to understand and control data access on HLM storage Coupled with data access latency this lack of understanding results in slow responses and potential time outs that affect the user experience The Swift HLM project addresses this challenge Running OpenStack Swift on top of HLM storage allows you to cheaply store and efficiently access large amounts of infrequently used object data Data that is stored on tape storage can be easily adopted to an Object Storage data interface This IBM Redpaper™ publication describes the Swift High Latency Media project and provides guidance for installation and configuration
