Geological Survey Water-supply Paper ,1971 **Forensic Science Progress** ,2012-12-06 Competitive binding techniques such as radioimmunoassay RIA are widely used to measure an enormous variety of compounds in biological fluids Current methods have 1 2 arisen from the pioneering work of Yalow and Berson in the U S A and Ekins in the u K Much of the early development was concerned with the analysis of protein hormones and nearly a decade passed before attention focussed also on small molecules such as steroids and drugs The potential of immunoassay methods for drug monitoring in clinical and forensic laboratories and in addict treatment programmes resulted in the commercial production of immunoassays for various therapeutic and abused drugs making the technique available to laboratories lacking the facilities to raise their own antisera and synthesise labelled compounds However commercial assays are not only expensive but are restricted in range and so it is advantageous for a forensic laboratory to have the capability to devise in house immunoassays suited to its particular requirements This chapter describes the theory and practice of RIA in forensic drug analysis Much of the theory and some of the practice are applicable to immunoassays in which non isotopic labels are used but such assays are not described in detail since to date the versatility and sensitivity of RIA have made it the immunoassay technique of choice in forensic toxicology The particular advantages of RIA are its sensitivity and the fact that samples such as haemolysed blood can be assayed with little or no prior preparation **Geological Survey Professional Paper** ,1980 **Xam idea**

Davidson,1997 This volume focuses on the use of quantum theory to understand and explain experiments in organic chemistry High level ab initio calculations when properly performed are useful in making quantitative distinctions between

various possible interpretations of structures reactions and spectra Chemical reasoning based on simpler quantum models is however essential to enumerating the likely possibilities The simpler models also often suggest the type of wave function likely to be involved in ground and excited states at various points along reaction paths This preliminary understanding is needed in order to select the appropriate higher level approach since most higher level models are designed to describe improvements to some reasonable zeroth order wave function Consequently most of the chapters in this volume begin with experimental facts and model functions and then progress to higher level theory only when quantitative results are required In the first chapter Zimmerman discusses a wide variety of thermal and photochemical reactions of organic molecules Gronert discusses the use of ab initio calculations and experimental facts in deciphering the mechanism of elimination reactions in the gas phase Bettinger et al focus on carbene structures and reactions with comparison of the triplet and singlet states Next Hrovat and Borden discuss more general molecules with competitive triplet and singlet contenders for the ground state structure Cave explains the difficulties and considerations involved with many of the methods and illustrates the difficulties by comparing with the UV spectra of short polyenes Jordan et al discuss long range electron transfer using model compounds and model Hamiltonians Finally Hiberty discusses the breathing orbital valence bond model as a different approach to introducing the crucial correlation that is known to be important in organic reactions
