Basics Timber Construction Ludwig Steiger, 2020-09-21 Timber is one of the most elementary and oldest building materials used by mankind and has still not lost any of its attractiveness and topicality In many cultural spheres and climate zones the primary construction methods of domestic architecture include both masonry construction and timber construction However this living lightweight and easy to work material has specific characteristics that impact on the way it is used in construction in different ways compared to other building materials In order to develop high quality designs that suit the material architects need to be familiar with the specific characteristics of this building material and with the rules governing timber construction The new edition of the successful Basics Timber Construction volume lists the most common solid timber construction systems including that using solid timber wall elements as well as the rules applications and the relevant details

Turning Point in Timber Construction Ulrich Dangel, 2016-12-05 Faced with man made climate change and the need to provide housing for a growing world population society needs to rethink the way future buildings are made Wood is a truly renewable building material that is unlimited in supply if its growth and harvest are sustainably managed Recent technological advancements in engineering allow the use of timber for the construction of multi story structures turning our buildings into carbon sinks rather than becoming sources for CO2 emissions The book presents convincing arguments for the increased use of wood as an alternative to more fossil fuel intensive building materials with the goal of demonstrating that an integrated approach can have the potential for positive impact on the environment local economies and the building culture at large

Basics Loadbearing Systems Alfred Meistermann, 2017-05-22 Loadbearing systems are the basis of any structure In order to provide architecture students with an easily understandable introduction to the field of supporting structures this volume begins with the fundamentals of loads and forces and then moves on to building components and finally to loadbearing systems together with their characteristic attributes Subjects Loads Forces Structural building components Supporting structures and systems Presizing

Timber Gridshells John Chilton, Gabriel Tang, 2016-11-10 Throughout history people have constructed simple timber lattice shelters such as the tepee or yurt covered with animal skins leaves grasses and woven fabrics Over the last fifty years more sophisticated webs of wood have emerged with timber gridshells in particular becoming a structurally expressive form of architecture Recent developments in digital design 3D modelling software timber fabrication technologies as well as trends towards low carbon construction have further reinforced architects interest in the use of lightweight timber grids and lattice structures This timely book charts the origin and evolution of the timber gridshell and its relation to timber lattice architecture Drawing on a range of international case studies the authors trace the effect advances in technology have had on design and construction in this field providing a clear understanding of the structure morphology design process and construction technology and examining both the application and constraints of timber gridshells in architectural design Timber Gridshells is a highly illustrated up to date resource which provides detailed answers and inspires new ideas As such it is essential reading for students of architecture as well as professional architects

Emergent Timber Technologies Simone Jeska, Khaled Saleh Pascha, 2014-10-27 The old material of wood has been used to construct dwellings of different types since the dawn of mankind And not without reason Its low density combined with high rigidity good processability and its resistance makes it an excellent building material There is currently a pioneering renaissance of the timber construction for two distinct reasons first wood is increasingly being rediscovered as one of the most important renewable raw materials for sustainable construction Moreover a revolution in the construction of timber structures began several years ago with the ever progressive use of three dimensional CAD

models for digitally controlled robot manufacturing The book documents these developments in particular the engineering bonding techniques the introduction of digital production techniques and the innovative material developments of this material The chapter on composite structures and experimental structures specifically address trends toward the future oriented dimensions of timber construction In the final section outstanding designs are documented in detail such as the Club House of Haesley Nine Bridges Golf Course designed by Shigeru Ban in Yeosu South Korea and the double gymnasium in Borex Crassier Switzerland by Graeme Mann and Patricia Capua Mann
