 Tire Pressure Monitoring Systems Guide ,2006 **Low Power Tire Pressure Monitoring System** Sravanthi
 Goparaju,2008 Power management is considered to be an important aspect in designing battery operated Tire Pressure
 Monitoring Systems TPMS as it helps to prolong the lifespan of the battery There are several methods that can be used to
 design a low power tire pressure and service monitoring system One of the most common methods for power reduction is the
 duty cycle method This thesis suggests an idea of implementing the TPMS in combination with a separate Radio Frequency
 Identification RFID circuit especially a very low power active or passive RFID whose sole purpose is to detect the
 interrogating signal This RFID circuit which can operate at a typical frequency of 125 kHz is used to turn ON a higher power
 transmitter which is initially in SLEEP state and soon after entering the active state performs the communication updating
 etc Once the desired task is completed the high power transmitter returns to SLEEP state or is turned off until the next
 interrogation The implementation of SLEEP mode to minimize power consumption is discussed in detail and the currents
 consumed by the microcontroller in SLEEP and ACTIVE modes are measured and recorded The microcontroller in SLEEP
 mode consumed a current of 17 μ A which reduced the overall average current consumed by the microcontroller and the
 pressure sensor Furthermore this method promises an improvement in the battery life and the calculations showing this
 improvement are discussed with the example of an AA battery with 2800mAh battery life Abstract Tire Pressure Systems
- Maintenance (ATIS) Type For Medium and Heavy Duty Highway Vehicles Truck and Bus Tire Committee,2023 This SAE
 Recommended Practice defines the system and component functions measurement metrics and testing methodologies for
 evaluating the functionality and performance of ground vehicle tire pressure maintenance ATIS systems systems which
 automatically restore the inflation pressure to its specified level and recommended maintenance practices for these systems
 within the known operating environments These systems are recommended to address all serviceable tires as originally
 installed on a vehicle by the OEM and or specialty vehicle manufacturer and for the aftermarket including replacement or
 spare parts are recommended but optional to address all tire rim combinations installed after initial vehicle sale or in use
 dates This document is applicable to all axle and all wheel combinations for the following vehicle types single unit powered
 vehicles exceeding 7257 kg 16 000 lb gross vehicle weight rating GVWR and multi unit vehicle combinations up to three
 towed units which use an SAE J560 connector for power and or communication or equivalent successor connector technology
 For combination vehicles including two or more trailers the dolly axles are also included The included vehicles can be newly
 manufactured vehicles or existing vehicles fitted with air or hydraulic braking systems SPECIAL NOTE Equipment known as

dual tire equalizers are commonly used with this category of vehicles When employing an ATIS system dual tire equalizers systems are not recommended as they run counter to the purpose of the maintenance system NOTE The following systems are not being addressed in this edition of the subject document 1The management system types and more mature complex versions of maintenance and management types to include on board reporting storage retrieval data control capabilities will be addressed separately by future changes additions to this document series 2Tire pressure monitoring systems These systems have been addressed under SAE J2848 1 Today the world of mobility is served extensively by tires which are pneumatic in design To function correctly these tire designs need pneumatic pressure to derive their performance characteristics optimum tread wear fuel economy ride quality or fatigue life hence the value of keeping the retained pressure at design levels ranks high While periodic inspection and the periodic action of adjusting the inflation pressure while a vehicle is at rest has been the norm for maintaining pressure the need to hold tire inflation pressures closer to their design targets over time even while operating a vehicle on the open road at highway speeds becomes apparent The minimum performance capabilities recommended in the following document support these needs Within the medium and heavy duty vehicle industry the equipment supplier community has responded to the need to maintain inflation pressure by developing various tire pressure systems which automatically re inflate the tire wheel assemblies even while operating on the highway Because these systems do not require any intervention or action by the operator operators will eventually come to rely upon these systems to maintain tire inflation pressure It is therefore important that all marketed systems provide an adequate level of performance to assure continued in service safety Tires and wheels are integral components of tire pressure systems The system attributes for tire pressure systems described herein assume an appropriate fitment of tire and wheel for each application and that these tire pressure systems are not dependent on the performance or physical characteristics of the tire or wheel components The substitution of one tire wheel assembly for another tire wheel assembly of another configuration appropriate for the vehicle system shall not render the tire pressure system inoperative so long as it provides a pneumatic chamber for the inflation gas Under SAE J2848 1 the system functions and performance expectations for tire pressure monitoring systems have been established The subject document SAE J2848 2 addresses tire pressure maintenance systems for which it is essential that the performance and communications to the driver be consistent with that established for tire pressure monitoring systems see Figure 1 SAE J2848 2 has been reaffirmed to comply with the SAE Five Year Review policy While tire pressure maintenance systems do not relieve the driver of his immediate responsibility to take the recommended maintenance action these systems must still keep the driver informed of the status of the pressure level and make him aware when the system applied is no longer performing its intended function This document incorporates the attributes of pressure maintenance systems into the management of tire inflation pressure while retaining the alerts and warnings so vitally important to the driver
