Remote Sensing of Northwest Himalayan Ecosystems R. R. Navalgund, A. Senthil Kumar, Subrata Nandy, 2018-10-18. Himalaya, one of the global biodiversity hotspots, is the abode of a variety of flora and fauna. The Himalayan ecosystems have immense ecological, socioeconomic and aesthetic significance as they provide a wide range of ecosystem services. The northwest Himalaya (NWH) covering three states of India viz. Uttarakhand, Himachal Pradesh and Jammu and Kashmir starts from the foothills of Shivaliks in the south and extends to the greater Himalaya in the north. This region is also the source of some of the major rivers of India. With the increase in population, the NWH ecosystems have been under threat due to deforestation, loss of biodiversity, expansion of agriculture and settlement, overexploitation of natural resources, habitat loss and fragmentation, poaching, mining, construction of roads and large dams and unplanned tourism. The Himalaya, being young and geotectonically active, remains inherently unstable, fragile and prone to natural disasters. Climate change is also likely to impact the Himalayan cryosphere drastically. Recognizing the importance of the

Himalaya a National Mission for Sustaining the Himalayan Ecosystem one of the eight missions under the National Action Plan on Climate Change NAPCC of Govt of India to conserve biodiversity forest cover and other ecological values in the Himalayan region has been taken up Spaceborne remote sensing with its ability to provide synoptic and repetitive coverage has emerged as a powerful tool for assessment and monitoring of the Himalayan resources and phenomena Indian Institute of Remote Sensing Dehradun has taken up a number of studies in the fields of geology water resources forestry agriculture urban settlement etc over the last decade The book summarises the work carried out in different disciplines illustrated with tables and figures and a host of relevant references It is hoped that the book serves as an excellent reference of immense value to the students researchers professors scientists professionals and decision makers working in the NWH region

Steinberg, 2022-01-03 As sequel to Aquatic Animal Nutrition A Mechanistic Perspective from Individuals to Generations the present treatise on organic macro and micronutrients continues the unique cross fertilization of aquatic ecology ecophysiology and aquaculture This treatise considers proteins and their constituents carbohydrates from mono to polysaccharides fatty acids from free acids to fat and waxes It becomes obvious that these organic nutrients are more than only simple fuel for the metabolism of animals rather their constituents have messenger and controlling function for the actual consuming individual and even for succeeding generations This aspect will become particularly clear by putting the organisms under consideration back into their ecosystem with their interrelationships and interdependencies Furthermore micronutrients such as vitamins and nucleotides as well as exogenous enzymes are in the focus of this volume with known and still to be discovered controlling physiological and biomolecular functions Aquatic Animal Nutrition Organic Macro and Micro Nutrients addresses several gaps in nutritional research and practice One major gap is the lack of common research standards and protocols for nutritional studies so that virtually incomparable approaches have to be compared This applies also to the studied animals since most approaches disregard intraspecific variabilities and the existence of epimutations in farmed individuals Furthermore recalling the Mechanistic Perspective from Individuals to Generations dietary benefits and

deficiencies have effects on succeeding generations In most studies this long term and sustainable aspect is overruled by pure short term production aspects By comparing nutritional behavior and success of fishes and invertebrates Aquatic Animal Nutrition points out different metabolic pathways in these animal groups and discusses how for instance fishes would benefit when having some successful metabolic pathway of invertebrates Application of novel genetic techniques will help turn this vision into reality However a widely missing link in the current nutritional research is epigenetics regarding transgenerational heritages of acquired morphological and physiological properties To increase public acceptance nutritional optimization of farmed animals based on this mechanism rather than genetical engineering appears promising Airway
