

Go to the library to find out about the circulatory system. Then fill in the blanks below using words from the box.

1. The circulatory system carries things throughout the human body. It carries food and air to every cell in the body.
2. The three most important parts of the system are the heart, blood, and blood vessels. The heart pumps blood through the blood vessels. The blood carries food and a gas called oxygen in one direction. It takes food, cell wastes, and the gas carbon dioxide in another direction.
3. Blood is a liquid. The liquid part of blood is called plasma. It has some solid parts called red blood cells, white blood cells, and platelets.
4. The heart is a pumping organ with four hollow chambers. The heart pumps blood to the body through arteries. Blood comes back to the heart through veins.
5. Red blood cells carry oxygen to the body. The chemical hemoglobin makes the blood look red.
6. White blood cells are needed to fight disease. They help kill bacteria.
7. The circulatory system is well-named because the blood goes in a "circle" that starts in the pumping blood, moves through the whole body, and comes back to the heart again.

Noninvasive Vascular Diagnosis Ali F. AbuRahma, 2017-10-02 This large format book is the definitive text on vascular surgery written by expert editors and contributors. It is well supported by exceptional illustrative material. The book is invaluable to all those who work in vascular laboratories as well as internists, cardiologists, vascular laboratory directors, and staff general surgeons involved in vascular surgery and the vascular surgery community in general. Noninvasive Vascular Diagnosis comprehensively covers all aspects of noninvasive evaluation of the circulatory system in the extremities. The increasing popularity of noninvasive techniques is not reflected in the number of comprehensive works on the topic, and it is clear from the success of the first edition that the demand for an updated volume is increasing.

Heaving, Stretching and Spicing Modes Rui Xin Huang, 2020-08-20 This book is focused on fundamental aspects of climate variability in the ocean, in particular changes of the wind-driven circulation. The vertical movement of isopycnal isothermal layers, including their stretching and compression, is called heaving and stretching. A major part of climate variability in the ocean is heaving in nature. Heave is primarily associated with the adiabatic motions of isopycnal layers due to change of wind stress. It is rather difficult to separate the contributions from adiabatic and diabatic processes. Isopycnal analysis has been widely used in climate study; however, it is much more accurate to study the isopycnal layers. Here, climate signals are examined in terms of changes of layer depth, layer thickness, layer temperature, salinity, spicity, and others. In addition to the traditional Theta-S diagram, the sigma-pi potential density potential spicity diagram can also be used in analyzing water mass property distribution and climate variability. In fact, a radius of signal can be defined rigorously for signals in the sigma-pi diagram. The combination of isopycnal analysis and evaluation of radius of signal provides a powerful tool in analyzing climate variability in the world oceans.

In Defense of an Evolutionary Concept of Health Dr Mahesh Ananth, 2012-10-01 One of the most controversial contemporary debates on the concept of health is the clash between the views of naturalists and normativists. Naturalists argue that although health can be valued or disvalued, the concept of health is itself objective and value-free. In contrast, normativists argue that health is a contextual and value-laden concept and that there is no possibility of a value-free understanding of health. This debate has fueled many of the often very acrimonious disputations arising from the claims of health, disease, and disability activists and charities and the public policy responses to them. In responding to this debate, Ananth both surveys the existing literature with special focus on the work of Christopher Boorse and argues that a naturalistic concept of health, drawing on evolutionary considerations associated with biological function, homeostasis, and species design, is defensible without jettisoning norms in their entirety.
