1. *Disproves that a 2000 public project is to be funded by the state off-budget for the public. Emphasizes that the private companies will be 50% and the state will be 50%.*

- (ii) Work out the opportunity cost to the economy of having the £100 in public funds;
- (iii) The cost premium on public funds represents a deadweight loss to the economy. Which group bears this cost? Explain.

100

- 207 Opponent's cost of increased savings (reduced consumption) = 2000  
 208 Opponent's cost of savings investment in (2000/10) = 2000/10 = 200  
 209 The benefit to the opponent is 2000/10 = 200  
 210 The benefit to the opponent is 2000/10 = 200

2. *Others that it private and public: Investments projects have been planned (over 100) that, even if not in the immediate past, have been scheduled during the period considered in the observation of the 1990-1999 time series results.*

100

For a two-period private investment the opportunity cost per dollar of investment is  $(1+r)(1+i)$ , where  $r$  is the before-tax and after-tax rate of return (assumed equal to the consumption rate of interest). If public consumption and investment are financed in the proportion  $(1-\alpha)$  and  $\alpha$  respectively, the effective price of public funds is  $(1-\alpha)(1+r)(1+i)$  and the discount rate to be substituted for public project is  $(1-\alpha)(1+r)(1+i)$ , where  $B$  is the user benefit next year and  $C$  is the cost this year. The effective rate is also an weighted average of the before-tax or opportunity cost rate of return and the consumption rate of interest:  $(1-\alpha)(1+r)(1+i) = (1-\alpha)(1+r) + \alpha(1+i)$ . There are two cases and the cases of  $(1-\alpha)(1+i) = 1 + (1-\alpha)r + \alpha i$ , which also are shown in the table.

8. Suppose that a competitive economy's labour supply consists of 5,000 units at the after-tax wage of \$2 per unit. The elasticity of labour supply is 0.025, and there is a flat-rate 40% tax on labour earnings. It is proposed to raise the tax on labour earnings to 50%, and the before-tax wage (which measures the value of the marginal product of labour) is not expected to change.

- ```

[1] How much extra revenue would the tax change yield?
[2] What, and the cost of the additional deadweight loss imposed on the
[3] economy by the tax increase?
[4] What, and the estimated cost of equity funds.

```

100

Use the elasticity estimate to work out the new quantity of labour supplied (40.54 units). Also check Figure 10.1 to work out the answers.

**Elements of Financial Risk Management** Peter Christoffersen, 2003-09-04. Elements of Financial Risk Management offers an introduction to modern risk management. It focuses on implementation, especially recent techniques which facilitate bridging the gap between standard textbooks on risk and real-life risk management systems. It identifies key features of risk-asset returns and captures them in tractable statistical models in the companion website. It presents step-by-step approaches as a means to solve problems. This book is intended for three types of readers with an interest in financial risk management: First, Master's and Ph.D. students specializing in finance and economics; Second, market practitioners with a quantitative undergraduate or graduate degree; Third, a small group of advanced undergraduates majoring in either economics, engineering, finance, or another quantitative field. The book will also suit those in financial engineering courses who have strong quantitative backgrounds and those in Ph.D. courses. Pinpoints key features of risk-asset returns and captures them in tractable statistical models in the companion website. Presents step-by-step approaches as a means to solve problems. Visible patterns in the data motivate the choices of tools, and when tools fall short, it presents the next tool.
