Structural Wood Design Abi Aghayere, Jason Vigil, 2007-07-30 A simple practical and concise guide to timber design To fully understand structural design in wood it is not sufficient to consider the individual components in isolation Structural Wood Design A Practice Oriented Approach Using the ASD Method offers an integrative approach to structural wood design that considers the design of the individual wood members in the context of the complete wood structure so that all of the

structural components and connectors work together in providing strength Holistic practical and code based this text provides the reader with knowledge of all the essentials of structural wood design Wood structural elements and systems that occur in wood structures Structural loads dead live snow wind and seismic and how to calculate loads acting on typical wood structures Glued laminated lumber and allowable stresses for sawn lumber and Glulam The design and analysis of joists and girders Floor vibrations The design of wood members subjected to axial and bending loads Roof and floor sheathing and horizontal diaphragms Exterior wall sheathing and wood shear walls The design of connections and how to use the connection capacity tables in the NDS code Several easy to use design aids for the preliminary sizing of joists studs and columns In keeping with its hallmark holistic and practice oriented approach the book culminates in a complete building design case study that brings all the elements together in a total building system design Conforming throughout to the 2005 National Design Specification NDS for Wood Structural Wood Design will prepare students for applying the fundamentals of structural wood design to typical projects and will serve as a handy resource for practicing engineers architects and builders in their everyday work **Guidelines for the Design of Footbridges** fib Fédération internationale du béton, 2005-01-01

The intention of fib Bulletin 32 is to present guidelines for the design of footbridges as well as bridges accommodating cyclists and bridleways equestrian paths The need for these guidelines comes from the fact that structural engineers designing footbridges currently have to spend considerable time and energy collecting information from numerous documents codes and recommendations to make design decisions There seems to be no international document dedicated solely to the design of footbridges These guidelines attempt to provide a concentrated source of information regarding all design issues specific to footbridges It is meant to be a liberal document in the sense that it promotes new innovative and bold yet prudent designs by sharing the experience of the authors summarizing specifications given in codes and presenting a collection of examples of well designed structures or structural details from around the world It is not intended to be an international code that specifies limits and admissible values thus encouraging timid conservative designs that are repetitions of approved and tested designs Indeed it may be the very fact that no international code exists specifically for footbridges that encourages the wide variety of footbridge designs found today It should be noted that numerous guidelines codes and books have been published on bridge design in general Information given in those publications that is also applicable to footbridges is not repeated in Bulletin 32 The chapters of these guidelines all follow the same pattern an introduction to the subject general guidelines as well as do s and don ts a summary of information found in existing international codes recommendations experience of the authors and built examples with comparison and comments on this information examples Plenty of illustrations and photographs help to visualize the themes of this work The last chapter Case Studies contains footbridges each with a short summary of main structural data and references for further reading
