## MAGNETIC SPEEDOMETERS

In the **Magnetic Movement** of Smiths motor cycle speedometers a magnet, rotated by a flexible cable, revolves close to a metal disc and tends to carry the disc round with it. A hairspring restrains the disc from revolving freely and the position of the speedometer pointer is determined by the drag of the magnet against the restraining force of the hairspring.

**Anti-Vibration Mounting** incorporated in the instrument case is an important feature of these instruments. This new type of A/V (anti-vibration) mounting within the instrument case has been designed to counteract vibrations and frequencies, set up when the machine is in motion, which could otherwise affect the correct functioning of the instrument. The mechanism is fixed to the case by means of rubber grommets with registered locking screws, and to the frame are attached three "snubbers" (A) to prevent the mechanism contacting the inside of the case if excessive vibration occurs.

**Fully Geared Counter Assembly** in the new magnetic A/V integral instruments, eliminates any possibility of mileage "slip" or "jumping".

The gears for driving the mileage counters consist of a brass worm (B) on the main spindle driving a heat-resisting plastic worm wheel (C), which engages the worm and counters made in a modified Polystyrene material.
