Fluid Mechanics: An Intermediate Approach helps readers develop a physics based understanding of complex flows and mathematically model them with accurate boundary conditions for numerical predictions. The new edition starts with a chapter reviewing key undergraduate concepts in fluid mechanics and thermodynamics, introducing the generalized conservation equation for differential and integral analyses. It concludes with a self study chapter on computational fluid dynamics (CFD) of turbulent flows including physics based postprocessing of 3D CFD results and entropy map generation for accurate interpretation and design applications. This book includes numerous worked examples and end of chapter problems for student practice. It also discusses how to numerically model compressible flow over all Mach numbers in a variable area duct, accounting for friction, heat transfer, rotation, internal choking and normal shock formation. This book is intended for graduate mechanical and aerospace engineering students taking courses in fluid mechanics and gas dynamics. Instructors will be able to utilize a solutions manual for their course.
