[Sulfur Metabolism in Phototrophic Organisms](#) Rüdiger Hell, Christiane Dahl, David B. Knaff, Thomas Leustek, 2008-03-19 Sulfur is one

of the most versatile elements in life due to its reactivity in different oxidation and reduction states. In phototrophic organisms, the redox properties of sulfur in proteins and of sulfur-containing metabolites are particularly important in the interaction between the reductive assimilation processes of photosynthesis and reactive oxygen species that arise as by-products of electron transport chains. Thiol groups in proteins and metabolites are targets of reactive oxygen species, resulting in potential damage and at the same time giving rise to redox signal cascades that trigger repair reactions and adaptation to environmental stress. Further reduced sulfur compounds play a prominent role as electron donors for photosynthetic carbon dioxide fixation in anoxygenic phototrophic sulfur bacteria. Interest in the investigation of the multiple functions of sulfur-related processes has increased exponentially in recent years, especially in molecular and cellular biology, biochemistry, agrobiotechnology, and ecology. This book provides for the first time in depth and integrated coverage of the functions of sulfur in phototrophic organisms, including bacteria, plants, and algae; it bridges gaps between biochemistry and cellular biology of sulfur in these organisms and of biology and environments dominated by them. This book is designed to be a comprehensive resource on sulfur in phototrophic organisms for advanced undergraduate and graduate students, beginning researchers, and teachers in the area of photosynthesis, bacterial energy metabolism, biotechnology, plant nutrition, plant production, and plant molecular physiology.

**Actinobacteria in Special and Extreme Habitats: Diversity, Function, Roles and Environmental Adaptations** Sheng Qin, Wen-Jun Li, Syed G. Dastager, Wael N. Hozzein, 2016-11-09

Actinobacteria are highly diverse prokaryotes that are ubiquitous in soil, freshwater, and marine ecosystems. Although various studies have focused on the ecology of this phylum, data are still scant on the diversity, abundance, and ecology of actinobacteria endemic to special and extreme environments such as gut, plant, alkaline, saline soil, deep sea sediments, hot springs, and other habitats. Actinobacteria are well-known producers of a vast array of secondary metabolites, many of which have useful applications in medicine and agriculture. Furthermore, actinobacteria also have diverse functions in different environments apart from antibiotic production. For example, actinobacteria are reported to contribute to the break-down and recycling of organic compounds. They play a significant role in nitrogen fixation, plant growth improvement, biodegradation, bioremediation, and environmental protection. Therefore, understanding the actinobacterial diversity and distribution in such special environments is important in deciphering the ecological roles of these microorganisms and for biotechnological bioprospecting. Recent advances in cultivation, DNA sequencing technologies, and omics (metagenomics, metaproteomics, etc.) methods have greatly contributed to the rapid advancement of our understanding of microbial diversity, function, and their interactions with the environment. Furthermore, comparative genomic studies can provide overall information about actinobacterial speciation, evolution, metabolism, and environment adaptation mechanisms. This research topic, comprising reviews and original articles, highlights the recent advances regarding the unexpectedly diverse, rare group of actinobacteria with special selective isolation methods or culture-independent methods, as well as their biological activities, ecophysiological

function and mechanisms from diverse special and extreme environments      **The Search for Biological Active Agent(s)**

**From Actinobacteria, 2nd Edition** Learn-Han Lee, Kok-Gan Chan, Jem Stach, Elizabeth M. H. Wellington, Bey-Hing Goh, 2020-03-27 There is a large market demand for new drugs The existing chronic or common ailments without cures development of new diseases with unknown causes and the widespread existence of antibiotic resistant pathogens have driven this field of research further by looking at all potential sources of natural products To date microbes have made a significant contribution to the health and well being of people globally The discoveries of useful metabolites produced by microbes have resulted in a significant proportion of pharmaceutical products in today s market Therefore the investigation and identification of bioactive compound s producing microbes is always of great interest to researchers Actinobacteria are one of the most important and efficient groups of natural metabolite producers Among the numerous genera Streptomyces have been recognized as prolific producers of useful natural compounds as they provide more than half of the naturally occurring antibiotics isolated to date and continue to emerge as the primary source of new bioactive compounds Certainly these potentials have attracted ample research interest and a wide range of biological activities have been subsequently screened by researchers with the utilization of different In vitro and In vivo model of experiments Literature evidence has shown that a significant number of interesting compounds produced by Actinobacteria were exhibiting either strong anticancer or neuroprotective activity The further in depth studies have then established the modulation of apoptotic pathway was involved in those observed bioactivities These findings indirectly prove the biopharmaceutical potential possessed by Actinobacteria and at the same time substantiate the importance of diverse pharmaceutical evaluations on Actinobacteria In fact many novel compounds discovered from Actinobacteria with strong potential in clinical applications have been developed into new drugs by pharmaceutical companies Together with the advancement in science and technology it is predicted that there would be an expedition in discoveries of new bioactive compounds producing Actinobacteria from various sources including soil and marine sources In light of these current needs and great interest in the scope of this research this book seeks to contribute on the investigation of different biological active compound s producing actinobacteria which are exhibiting antimicrobial antioxidant neuroprotective anticancer activities and similar      **Vaccines for Pandemic**

**Influenza** Richard W Compans, Walter A. Orenstein, 2009-09-18 Recent years have seen unprecedented outbreaks of avian influenza A viruses In particular highly pathogenic H5N1 viruses have not only resulted in widespread outbreaks in domestic poultry but have been transmitted to humans resulting in numerous fatalities The rapid expansion in their geographic distribution and the possibility that these viruses could acquire the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality An effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic However current influenza vaccines are directed at existing seasonal influenza viruses which have little or no antigenic relationship to the highly pathogenic H5N1 strains

Concerns about pandemic preparedness have greatly stimulated research activities to develop effective vaccines for pandemic influenza viruses and to overcome the limitations inherent in current approaches to vaccine production and distribution. These limitations include the use of embryonated chicken eggs as the substrate for vaccine production which is time consuming and could involve potential biohazards in growth of new virus strains. Other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes requiring trained personnel which could be a bottleneck when attempting to vaccinate large populations in mass campaigns. In addition, the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated.
