Statistics of Earth Science Data Graham J. Borradaile,2013-11-11 The Goals of Data Collection and Its Statistical Treatment in the Earth Sciences The earth sciences are characterised by loose and complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution Our frequency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error Furthermore earth scientists cannot design experiments according to statistical recommendation because the availability and complexity of data are beyond our control Usually the system we are studying cannot be isolated into discrete independent variables These factors influence the first steps of research how and where to collect specimens or observations Some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course These include spatial sampling methods orientation data regionalised variables time series identification of cyclicity and pattern discrimination multivariate systems lurking variables and constant sum data It is remarkable that most earth science students confront these issues without formal training or focused consideration

Transactions of the National Safety Council ... Annual Safety Congress National Safety Council. Safety Congress,1929 Crime Is Not the Problem Franklin E. Zimring,Gordon Hawkins,1999-05-27 In Crime is Not the Problem Franklin Zimring and Gordon Hawkins revolutionize the way we think about crime and violence by forcing us to distinguish between crime and violence The authors reveal that compared to other industrialized nations in most categories of nonviolent crime American crime rates are comparable even lower in some cases Only when it comes to lethal violence does the United States outpace other Western nations with homicide rates many many times greater London and New York City have nearly the same number of robberies and burglaries each year but robbers and burglars kill 54 victims in New York for every victim death in London Why are the risks so much greater that victims will be killed or maimed in the United States And what can be done to bring the death rate from American violence down to tolerable levels The authors show how the impact of television and movie violence on rates of homicide is wildly overrated but emphasize the paramount importance of guns By making the crucial distinction between lethal violence and crime in general the authors clear the ground for a targeted far more effective response to the real crisis in American society Crime is Not the Problem will reshape the debate about crime control in the United States Safety and Soundness Issues Related to Bank Derivatives Activities United States. Congress. House. Committee on Banking, Finance, and Urban Affairs,1994 **Never Waste a Good Crisis** Klaas Sijsma,2023-06-15 This book covers statistical consequences of breaches of research integrity such as fabrication and falsification of data and researcher glitches summarized as questionable research practices It is unique in that it discusses how unwarranted data manipulation harms research results and that questionable research practices are often caused by researchers inadequate mastery of the statistical methods and procedures they use for their data analysis The author s solution to prevent problems concerning the trustworthiness of research results no matter how they originated is to publish data in publicly available repositories and encourage researchers not trained as statisticians not to overestimate their statistical skills and resort to professional support from statisticians or methodologists The author discusses some of his experiences concerning mutual trust fear of repercussions and the bystander effect as conditions limiting revelation of colleagues possible integrity breaches He explains why people are unable to mimic real data and why data fabrication using statistical models stills falls short of

credibility Confirmatory and exploratory research and the usefulness of preregistration and the counter intuitiveness of statistics are discussed The author questions the usefulness of statistical advice concerning frequentist hypothesis testing Bayes factor use alternative statistics education and reduction of situational disturbances like performance pressure as stand alone means to reduce questionable research practices when researchers lack experience with statistics An interview with the author can be found here <https://www.tilburguniversity.edu/magazine/overview-former-rector-sijtsma-turn-statistician-fight-fraud-and-sloppiness>
