Time In Powers Of Ten:

Natural Phenomena And Their Timescales Gerard 't Hooft, Stefan Vandoren, 2014-05-12 With a Foreword by Steven Weinberg In this richly illustrated book Nobel Laureate Gerard 't Hooft and Theoretical Physicist Stefan Vandoren describe the enormous diversity of natural phenomena that take place at different time scales In the tradition of the bestseller Powers of Ten the authors zoom in and out in time each step with a factor of ten Starting from one second time scales are enlarged until processes are reached that take much longer than the age of the universe After the largest possible eternities the reader is treated to the shortest and fastest phenomena known Then the authors increase with powers of ten until again the second is reached at the end of the book At each time scale interesting natural phenomena occur spread over all scientific disciplines orbital and rotation periods of planets and stars decay times of elementary particles and atoms biological rhythms and evolution processes but also the different geological time scales remove

Lives of the Planets Richard Corfield, 2007-08-01 Lives of the Planets describes a scientific field in the midst of a revolution Planetary science has mainly been a descriptive science but it is becoming increasingly experimental The space probes that went up between the 1960s and 1990s were primarily generalists they collected massive amounts of information so that scientists could learn what questions to pursue But recent missions have become more focused Scientists know better what information they want and how to collect it Even now probes are on their way to Mercury Venus Mars and Pluto with Europa one of Jupiter's moons on

the agenda In a sweeping look into the manifold objects inhabiting the depths of space *Lives of the Planets* delves into the mythology and the knowledge humanity has built over the ages Placing our current understanding in historical context Richard Corfield explores the seismic shifts in planetary astronomy and probes why we must change our perspective of our place in the universe In our era of extraordinary discovery this is the first comprehensive survey of this new understanding and the history of how we got here

Planetary Systems Raymond T. Pierrehumbert, 2021-12-09 Not long ago the Solar System was the only example of a planetary system a star and the bodies orbiting it that we knew Now we know thousands of planetary systems and have even been able to observe planetary systems at the moment of their birth This Very Short Introduction explores this new frontier incorporating the latest research The book takes the reader on a journey through the grand sweep of time from the moment galaxies begin to form after the Big Bang to trillions of years in the future when the Universe will be a dilute soup of dim galaxies populated mostly by red dwarf stars Throughout Raymond T Pierrehumbert introduces the latest insights gained from a new generation of telescopes that catch planetary systems at the moment of formation and to the theoretical advances that attempt to make sense of these observations He explains how the elements that make up life and the planets on which life can live are forged in the interiors of dying stars and make their way into rocky planets He also explores the vast array of newly discovered planets orbiting stars other than our own and explains the factors that determine their climates Finally he reveals what determines how long planetary systems can live and what happens in their end times
