

Fig. 20 On 3.0 hp motors, remove the oil drain plug (which is also the filter on early-model motors) from the rear of the powerhead just underneath the cooling fins.

On 3.0 hp motors, there is a reusable element mounted either at the lower portion of the oil pan (under the powerhead at the rear of the motor on early models) or at a fitting on the starboard side of the powerhead just below the oil tank (later models). Although the element is reusable, Yamaha recommends replacing it annually to ensure proper oil filtration. The oil filter on 3.0 hp motors also is a disposable, synthetic foam-type spin-on filter mounted to the side of the powerhead. The filter is used to remove the spin-on filter (which is used on later models) in a filter canister, and is replaced in the oil canister after the oil is changed. When changing a replacement oil filter, make sure you have made sure of sufficient space for a spin-on filter. The oil filter is a disposable element that is used to filter the oil from the oil pan. It is a reusable element, and should be replaced after every oil change. The oil filter is a disposable element that is used to filter the oil from the oil pan. that are still held in suspension. Of course, the oil can be messy or even a bit dangerous to work with. Coupled with the somewhat difficult method of draining oil from an outboard, this might make it better in some instances to drain the oil out. Of course, if this is desired, you'll have to leave more time for the oil to drain completely. Always remember to make arrangements to dispose of the oil properly. The choice is really yours, but be sure to take the appropriate steps to protect yourself either way.

■ If the engine is not being placed in storage after the oil change, it should be run to normal operating temperature (20 to 30° F) with a cooling element and inspected for leaks before starting. If it is desired, the engine is being placed in storage it should also be run using a float device for a few minutes to run it out long. Just start and run the engine for a few minutes to thoroughly circulate the fresh oil, then prepare it for storage by tipping the motor.

Fig. 21 On late-model 3.0's the oil filter is threaded into a hole just behind the flywheel.
