How To Diagnose and Repair Automotive Electrical Systems Tracy Martin, 2005 **Analysis and Design of the Power-Split Device for Hybrid Systems** Xiaohua Zeng, Jixin Wang, 2017-10-04 This book presents a comprehensive overview of power split device PSD design It discusses vehicle energy consumption characteristics hybrid vehicle power request solutions typical configurations operating principle and simulation technology of PSD hybrid system a multi factor integrated parametric design method and a dynamic coordinated control method for PSD hybrid system It also describes the finite element analysis thermal analysis and optimization of the PSD based on a surrogate model explains the theory behind the design and the simulation and provides concrete examples It is a valuable resource for researchers and the engineers to gain a better understanding of the PSD design process *Understanding Technological Systems* John Krupczak, Jr., 2023-11-27 This book is about understanding technology using the perspective of systems It addresses the need for an accessible approach to understanding the broad range of technological devices and systems that create the modern world Understanding technological systems offers an introduction to engineering and technology centered on the underlying structure common to all technological objects This framework views technological systems as created using components to provide specific capabilities or functions Components contributing well defined functions interact with other components to create systems Major topics include the concepts of technological function and the embedding of functional capabilities in physical components the hierarchical nature of systems and the clustering of related systems into technological domains The book fills the gap between engineering science and engineering design **Electric Vehicle Progress**, 1998 Automotive Sensory Systems C. Nwagboso, 1993-06-30 The rapidly growing need for mobility has brought with it a major challenge for improvement in the operation and utilization of automotive systems The economical environmental and safety constraints imposed by the increase in the number of road vehicles and subsequent government policies also require substantial product development through the application of information technology This involves the enhancement of vehicle informatics and telematic systems with additional sensors and systems The advance in the design and development of automotive sensory systems is so rapid that there is urgent need for the experts involved in the technology to work together to provide a reference book for the engineer of today and tomorrow This motivated me to spend two years researching the topics and the basis on which such a book should be written The result is the present compilation of the work of international experts on the state of the art in the field of automotive sensory systems Thus a unique collection has been created for the reference of all those concerned with or interested in the design and development of modern safe and intelligent vehicles Although this book is intended for engineers managers scientists academicians and policy makers students should also find it valuable To meet the requirements of students the basics are explained in simple terms however it is hoped that others will appreciate this approach since most of us are well aware that gaps remain in our knowledge of the elements of our profession

Vehicle Propulsion Systems Lino Guzzella, Antonio

Sciarretta, 2007-09-21 In this book the longitudinal behavior of road vehicles is analyzed The main emphasis is on the analysis and minimization of the fuel and energy consumption Most approaches to this problem enhance the complexity of the vehicle system by adding components such as electrical motors or storage devices Such a complex system can only be designed by means of mathematical models This text gives an introduction to the modeling and optimization problems typically encountered when designing new propulsion systems for passenger cars It is intended for persons interested in the analysis and optimization of classical and novel vehicle propulsion systems Its focus lies on the control oriented mathematical description of the physical processes and on the model based optimization of the system structure and of the supervisory control algorithms This text has evolved from a lecture series at ETH Zurich Prerequisites are general engineering topics and a first course in optimal control theory
