Science and Environment in Chile Javiera Barandiaran, 2018-07-31 The politics of scientific advice across four environmental conflicts in Chile when the state acted as a neutral broker rather than protecting the common good In *Science and Environment in Chile* Javiera Barandiaran examines the consequences for environmental governance when the state lacks the capacity to produce an authoritative body of knowledge Focusing on the experience of Chile after it transitioned from dictatorship to democracy she examines a series of environmental conflicts in which the state tried to act as a neutral broker rather than the protector of the common good She argues that this shift in the role of the state occurring in other countries as well is driven in part by the political ideology of neoliberalism which favors market mechanisms and private initiatives over the actions of state agencies Chile has not invested in environmental science labs state agencies with in house capacities or an ancillary network of trusted scientific advisers despite the growing complexity of environmental problems and increasing popular demand for more active environmental stewardship Unlike a high modernist empire state with the scientific and technical capacity to undertake large scale projects Chile's model has been that of an umpire state that purchases scientific advice from markets After describing the evolution of Chilean regulatory and scientific institutions during the transition Barandiaran describes four environmental crises that shook citizens trust in government the near collapse of the farmed salmon industry when an epidemic killed millions of fish pollution from a paper and pulp mill that killed off or forced out thousands of black neck swans a gold mine that threatened three glaciers and five controversial mega dams in Patagonia

Century to Combat Obesity, Undernutrition and Climate Change, 2nd edition Rebecca Kanter,Sofia Boza,Gina Kennedy,2023-07-31 Traditional and indigenous food systems have existed for centuries and were in balance with local food supplies globally However between the mid 20th and early 21st century the green revolution dramatically altered food production which in turn affected the inclusivity of traditional production systems within food systems and subsequently traditional dietary intakes This change was accompanied by lifestyle changes and spurred a global nutrition transition Today the world faces a global syndemic of obesity undernutrition and climate change A new call to action to create food systems that nourish people and sustain the planet is needed Traditional and indigenous food systems have long been recognized as systems that can both support good human nutrition as well as maintain a balance with nature There is an underutilized knowledge base around traditional and indigenous food systems This includes the knowledge of nutritious species traditional culinary preparations and cultural practices Greater agricultural production of underutilized species can result in more

sustainable agricultural and food systems which can also help improve livelihoods and food security Traditional and indigenous cultural practices with respect to both land and water management as well as culinary practices contribute to both sustainable food production and consumption These practices require a greater evidence base in order to be incorporated into public health nutrition initiatives related to improving dietary quality such as food based dietary guidelines for example An increased focus on the importance of local traditional and indigenous food systems and nutrition could therefore help countries to improve human nutrition and ideally help mitigate the global syndemic of obesity undernutrition and climate change This Research Topic will focus on documenting diverse local food systems and promoting elements within them that can help improve nutrition and health both human and planetary in various ways including the livelihood development of knowledge holders
