Axial Skeleton Anatomy The skeletal system forms the rigid internal framework of the body It consists of the bones cartilages and ligaments Bones support the weight of the body allow for body movements and protect internal organs Cartilage provides flexible strength and support for body structures such as the thoracic cage the external ear and the trachea and larynx At joints of the body cartilage can also unite adjacent bones or provide cushioning between them Ligaments are the strong connective tissue bands that hold the bones at a moveable joint together and serve to prevent excessive movements of the joint that would result in injury Providing movement of the skeleton are the muscles of the body which are firmly attached to the skeleton via connective tissue structures called tendons As muscles contract they pull on the bones to produce movements of the body Thus without a skeleton you would not be able to stand run or even feed yourself Chapter Outline Divisions of the Skeletal System The Skull The Vertebral Column The Thoracic CageEmbryonic Development of the Axial Skeleton The Open Courses Library introduces you to the best Open Source Courses
