

The safety-contact-edge SKL 15-10 TT is employed to guard closing edges at possible crushing or shearing points. They are used in gates, machines and handling facilities to protect people and equipment. It consists of the signal initiator and the aluminium-profile. The shaping of the SKL 15-10 TT and the special TPE-mixture ensure low actuating forces by a far temperature range.

The quiescent current principle used here is the basis for the constant functional monitoring. The last safety-contact-edge of a possible series connection is completed with a terminal resistor which is continuously measured by the evaluation electronic. By this structure also the entire line distance is monitored for short-circuit and wire break.

The structure

The safety contact edge SKL 15-10 TT is implemented as a single chamber profile. Thus the production of the contact edge is simplified, because only the connecting pieces must be assembled.

The main advantages to other switching elements are the components of material and the good geometry. The absolutely homogeneous, high-insulating external material made of TPE is provided with two conductive switching surfaces on the inside. The two copper braids inside these conductive elastomers make a low impedance evaluation possible also with lengths of more than 100 meters.

maneuver forces vulnerable to air attack by fixed and rotary wing aircraft unmanned aircraft systems and cruise missiles
 Maneuver forces lack capacity and capability to address these threats and the Army requires a speedy response Stinger
 missiles provide a key capability for maneuver forces to defend themselves from aerial observation and attack However
 without direct involvement from senior brigade combat team leaders and effective leader training these missiles will become

Tang, Mika Sillanpää, 2018-08-01 The important resource that explores the twelve design principles of sustainable environmental engineering. Sustainable Environmental Engineering (SEE) is to research design and build Environmental Engineering Infrastructure System (EEIS) in harmony with nature using life cycle cost analysis and benefit analysis and life cycle assessment and to protect human health and environments at minimal cost. The foundations of the SEE are the twelve design principles (TDPs) with three specific rules for each principle. The TDPs attempt to transform how environmental engineering could be taught by prioritizing six design hierarchies through six different dimensions. Six design hierarchies are prevention recovery separation treatment remediation and optimization. Six dimensions are integrated system material economy reliability on spatial scale resiliency on temporal scale and cost effectiveness. In addition the authors two experts in the field introduce major computer packages that are useful to solve real environmental engineering design problems. The text presents how specific environmental engineering issues could be identified and prioritized under climate change through quantification of air water and soil quality indexes. For water pollution control eight innovative technologies which are critical in the paradigm shift from the conventional environmental
