Intracellular Signaling Mediators in the Circulatory and Ventilatory Systems Marc Thiriet, 2012-09-26 The volumes in this authoritative series present a multidisciplinary approach to modeling and simulation of flows in the

cardiovascular and ventilatory systems especially multiscale modeling and coupled simulations The cardiovascular and respiratory systems are tightly coupled as their primary function is to supply oxygen to and remove carbon dioxide from the body's cells Because physiological conduits have deformable and reactive walls macroscopic flow behavior and prediction must be coupled to phenomenological models of nano and microscopic events in a corrector scheme of regulated mechanisms when the vessel lumen caliber varies markedly Therefore investigation of flows of blood and air in physiological conduits requires an understanding of the biology chemistry and physics of these systems together with the mathematical tools to describe their functioning Volume 4 is devoted to major sets of intracellular mediators that transmit signals upon stimulation of cell surface receptors Activation of signaling effectors triggers the release of substances stored in cellular organelles and or gene transcription and protein synthesis Complex stages of cell signaling can be studied using proper mathematical models once the role of each component is carefully handled Volume 4 also reviews various categories of cytosolic and or nuclear mediators and illustrates some major signal transduction pathways such as NFkappaB axis oxygen sensing and mechanotransduction
