Vector Optimization Theory Applications And Extensions:

Vector Optimization Johannes Jahn, 2013-06-05 In vector optimization one investigates optimal elements such as minimal, strongly minimal, properly minimal or weakly minimal elements of a nonempty subset of a partially ordered linear space. The problem of determining at least one of these optimal elements if they exist at all is also called a vector optimization problem. Problems of this type can be found not only in mathematics but also in engineering and economics. Vector optimization problems arise for example in functional analysis, the Hahn-Banach theorem, the lemma of Bishop-Phelps, Ekeland's variational principle, multiobjective programming, multi-criteria decision making, statistics, Bayes solutions, theory of tests, minimal covariance matrices, approximation theory, location theory, simultaneous approximation, solution of boundary value problems and cooperative game theory, cooperative n -player differential games and as a special case, optimal control problems. In the last decade, vector optimization has been extended to problems with set-valued maps. This new field of research called set optimization seems to have important applications to variational inequalities and optimization problems with multivalued data. The roots of vector optimization go back to F.Y. Edgeworth (1881) and V. Pareto (1896) who has already given the definition of the standard optimality concept in multiobjective optimization. But in mathematics, this branch of optimization has started with the legendary paper of H.W. Kuhn and A.W. Tucker (1951). Since about the end of the 60's, research is intensively made in vector optimization.

Vector Optimization Johannes Jahn, 2010-11-22 Fundamentals and important results of vector optimization in a general setting are presented in this book. The theory developed includes scalarization, existence theorems, a generalized Lagrange multiplier rule and duality results. Applications to vector approximation, cooperative game theory and multiobjective optimization are described. The theory is extended to set optimization with particular emphasis on contingent epiderivatives, subgradients and optimality conditions. Background material of convex analysis being necessary is concisely summarized at the beginning. This second edition contains new parts on the adaptive Eichfelder-Polak method, a concrete application to magnetic resonance systems in medical engineering and additional remarks on the contribution of F.Y. Edgeworth and V. Pareto. The bibliography is updated and includes more recent important publications.

Vector Optimization Guang-ya Chen, Xuexiang Huang, Xiaogi Yang, 2005-11-20 Vector optimization model has found many important applications in decision making problems such as those in economics theory management science and engineering design since the introduction of the Pareto optimal solution in 1896 Typical examples

of vector optimization model include maximization minimization of the objective pairs time cost benefit cost and mean variance etc Many practical equilibrium problems can be formulated as variational inequality problems rather than optimization problems unless further assumptions are imposed The vector variational inequality was introduced by Giannessi 1980 Extensive research on its relations with vector optimization the existence of a solution and duality theory has been pursued The fundamental idea of the Ekeland's variational principle is to assign an optimization problem a slightly perturbed one having a unique solution which is at the same time an approximate solution of the original problem This principle has been an important tool for nonlinear analysis and optimization theory Along with the development of vector optimization and set valued optimization the vector variational principle introduced by Nemeth 1980 has been an interesting topic in the last decade Fan Ky's minimax theorems and minimax inequalities for real valued functions have played a key role in optimization theory game theory and mathematical economics An extension to vector payoffs was introduced by Blackwell 1955
