Each is introduced with characteristics then discussed in detail. Finally this book discusses future research directions to inspire further investigation in the field of vehicular channels from three different perspectives. **Recent Advances in Signal Processing** Ashraf Zaher, 2009-11-01 The signal processing task is a very critical issue in the majority of new technological inventions and challenges in a variety of applications in both science and engineering fields. Classical signal processing techniques have largely worked with mathematical models that are linear local stationary and Gaussian. They have always favored closed form tractability over real world accuracy. These constraints were imposed by the lack of powerful computing tools. During the last few decades signal processing theories developments and applications have matured rapidly and now include tools from many areas of mathematics computer science physics and engineering. This book is targeted primarily toward both students and researchers who want to be exposed to a wide variety of signal processing techniques and algorithms. It includes 27 chapters that can be categorized into five different areas depending on the application at hand. These five categories are ordered to address image processing speech processing communication systems time series analysis and educational packages respectively. The book has the advantage of providing a collection of applications that are completely independent and self contained thus the interested reader can choose any chapter and skip to another without losing continuity.
