Tejesvi,Anna Maria Pirttilä,A. Carolin Frank,2017-07-27 Plants are typically colonized by numerous endophyte species symbiotically without any noticeable disease symptoms These microbes are abundant diverse and play critical ecological roles across natural and agricultural ecosystems Endophytes have attracted the attention of researchers due to their various beneficial effects on plants especially in agricultural crop species Genomic tools will enhance our understanding on the growth and nutrition

requirements of this host symbiont relationship Recent advances in DNA sequencing technologies and bioinformatic pipelines have allowed analyzing the plant microbiome and host endophyte interaction more effectively with limited bias Furthermore various studies have employed and utilized transcriptomic and genomic tools to understand the role of endophytes and their interaction with plant hosts This electronic book covers various research articles highlighting the important developments on endophytes using transcriptomics next generation sequencing and genomic tools *Theory of Mind in Relation to Other Cognitive Abilities, volume II* Ann Dowker,Douglas Frye,2025-08-11 This Research Topic is the second volume of the Research Topic Theory of Mind in Relation to Other Cognitive Abilities Please see the first volume here Theory of mind and its development have been subjects of much research over the last 40 years It is generally thought to be very important in cognitive and social development However there is still much debate as to how it should be defined and even as to whether it is a single entity In particular there is controversy as to the extent to which it should be seen as a specific cognitive module or rather as dependent on or mutually developing with other cognitive abilities and characteristics such as language metacognition executive function and cognitive and perceptual styles that emphasize gist versus detail strong versus weak central coherence It is also possible that the theory of mind itself has several different components which may be related to different degrees different cognitive abilities and characteristics Any relationships between the theory of mind and other cognitive characteristics may also vary with age and may differ between typically developing children and those with autism and other atypical conditions Gaining a greater understanding of these issues is important to increasing our understanding of theory of mind itself the nature of cognitive development the similarities and differences between typically and atypically developing children and whether it may be possible to devise interventions to improve theory of mind either directly or by means of improving other abilities The goal of the current Research Topic is to bring together articles on various aspects of the theory of mind and any concurrent and longitudinal relationships to other cognitive abilities and characteristics These articles may involve studies of children adults or both It is expected that they will primarily include empirical research papers but theoretical articles literature reviews and meta analyses are also welcome *International Aerospace Abstracts* ,1998

Energy Research Abstracts ,1991 *Federal Register* ,1985-04 **Scientific and Technical Aerospace Reports** ,1970 **Magnetic resonance imaging of disturbed brain connectivity in psychiatric illness** Alex Fornito,Ben Harrison, The widespread application of brain imaging to the study of psychiatric disorders has led to a revolution in our understanding of the neural basis of psychiatric illness In particular the advent of magnetic resonance imaging MRI has provided an unprecedented capacity for quantifying diverse aspects of brain structure and function in vivo and has been used to identify brain changes associated with the full spectrum of psychopathology With respect to major psychiatric disorders it is now abundantly clear from this literature that focal brain dysfunction is rare Rather most disorders are associated with abnormalities in large scale networks of spatially distributed and interconnected brain regions i e they are disorders of brain

connectivity Such considerations highlight the need to understand brain dysfunction in psychiatric illness from a network based perspective This goal is starting to be realized through recent advances in the use of MRI to map the brain s complex connectivity architecture In this special edition we invite contributions that address brain network dysfunction in psychiatric illnesses Specifically the work must be concerned with understanding interactions between brain regions and how their alterations are affected by psychiatric disease These interactions can be studied at the level of anatomy using diffusion MRI or function using functional MRI fMRI with the full range of methods available e g tractography seed based correlations independent component analysis graph analysis dynamic causal modeling etc Contributions can be either reviews of recent relevant literature addressing brain network dysfunction in psychiatric disease or experimental papers describing novel insights into brain network disturbances in such illnesses Contributions will be invited covering a broad spectrum of psychiatric disease including mood and anxiety disorders schizophrenia autism attention deficit hyperactivity disorder and neurodegenerative conditions It is intended that this volume will provide important insights into how brain networks are perturbed by psychiatric disease and allow identification of commonalities and differences across diagnostic categories

Government Reports Announcements & Index ,1994-10 *Ear-Centered Sensing: From Sensing Principles to Research and Clinical Devices, Volume II* Martin Georg Bleichner,Preben Kidmose,Jérémie Voix,2023-11-28 This Research Topic is part of the Ear Centered Sensing From Sensing Principles to Research and Clinical Devices series From Sensing Principles to Research and Clinical Devices Volume I The human ears are an attractive location for bio signal acquisition Heart rate respiratory rate eye blink and eye motion signals and skin conductance as well as the electrical activity from muscles and the brain can be recorded from the ear Moreover the ears provide a discreet and natural anchoring point for placing the necessary wearable hardware thereby reducing the visibility of integrated devices We define ear centered sensing as monitoring physiological signals with sensors located in the ear canal in the pinna or around the ear Ear centered sensing allows data recording over extended periods of time in everyday situations with little disturbance for the users The combination of physical measurements such as motion temperature and moisture and electrophysiological measurements such as electroencephalography EEG electrocardiography ECG electromyography EMG electrooculography EOG and electrodermal activity EDA for example integrated over long time periods will help to gain a better understanding of psycho physiological processes Ear centered sensing is therefore of interest for scientific diagnostic and therapeutic purposes and we believe that it will play a significant role in future mobile health applications As the ear is an unconventional place for monitoring these physiological measures a common challenge for ear centered sensing is to gain a better understanding of the signals that are recorded at this location The questions that need to be answered are How does the signal e g ECG or EEG acquired at the ear relate to the signal as acquired at the classical recording sites Which signals are ear centered systems sensitive to which signals are lost How can we reliably discriminate in real time signals from artifacts And finally

how do we interpret data that is acquired over extended periods of time when we have little or no control over the recording environment For the sensing of physiological signals over extended periods of time dedicated sensor and amplifier technology is needed that is convenient to use robust and reliable People wearing these sensors should not be restricted in their activities Hence for long term usage sensor and amplifier technology need to be unobtrusive in every aspect the materials need to be biocompatible adjust to the individual s anatomy and be comfortable to wear They need to be sufficiently robust to allow for continued usage and self fitting and they need to be small and inconspicuous The electronic instrumentation including bio signal conditioners and amplifiers analog to digital converters means for signal processing and wireless transmission need to be sufficiently small and light weight to be placed at the ear together with the sensors The power supply has to be secured either by low power electronics or by smart ways to recharge the battery or even by harvesting body energy For the tiny signal changes as produced for example by brain activity amplifiers need to be sensitive enough to detect them while maintaining robust artifact rejection capabilities
