transportation systems control theory hybrid systems and applications **Software for Algebraic Geometry** Michael E. Stillman, Nobuki Takayama, Jan Verschelde, 2008-05-29 Algorithms in algebraic geometry go hand in hand with software packages that implement them Together they have established the modern field of computational algebraic geometry which has come to play a major role in both theoretical advances and applications Over the past fifteen years several excellent general purpose packages for computations in algebraic geometry have been developed such as CoCoA Singular and Macaulay 2 While these packages evolve continuously incorporating new mathematical advances they both motivate and demand the creation of new mathematics and smarter algorithms This volume reflects the workshop Software for Algebraic Geometry held in the week from 23 to 27 October 2006 as the second workshop in the thematic year on Applications of Algebraic Geometry at the IMA The papers in this volume describe the software packages Bertini PHClab Gfan DEMiCs SYNAPS TrIm Gambit ApaTools and the application of Risa Asir to a conjecture on multiple zeta values They offer the reader a broad view of current trends in computational algebraic geometry through software development and applications

Algorithms in Algebraic Geometry Alicia Dickenstein, Frank-Olaf Schreyer, Andrew J. Sommese, 2010-07-10 In the last decade there has been a burgeoning of activity in the design and implementation of algorithms for algebraic geometric computation The workshop on Algorithms in Algebraic Geometry that was held in the framework of the IMA Annual Program Year in Applications of Algebraic Geometry by the Institute for Mathematics and Its Applications on September 2006 is one tangible indication of the interest This volume of articles captures some of the spirit of the IMA workshop

Stochastic-Process Limits Ward Whitt, 2006-04-11 Stochastic Process Limits are useful and interesting because they generate simple approximations for complicated stochastic processes and also help explain the statistical regularity associated with a macroscopic view of uncertainty This book emphasizes the continuous mapping approach to obtain new stochastic process limits from previously established stochastic process limits The continuous mapping approach is applied to obtain heavy traffic stochastic process limits for queueing models including the case in which there are unmatched jumps in the limit process These heavy traffic limits generate simple approximations for complicated queueing processes and they reveal the impact of variability upon queueing performance The book will be of interest to researchers and graduate students working in the areas of probability stochastic processes and operations research In addition this book won the 2003 Lanchester Prize for the best contribution to Operation Research and Management in English see <http://www.informs.org/Prizes/LanchesterPrize.html> *Natural Locomotion in Fluids and on Surfaces* Stephen Childress, Anette Hosoi, William W. Schultz, Jane Wang, 2012-08-14 This volume developed from a Workshop on Natural Locomotion in Fluids and on Surfaces Swimming Flying and Sliding which was held at the Institute for Mathematics and its Applications IMA at the University of Minnesota from June 1 5 2010 The subject matter ranged widely from observational data to theoretical mechanics and reflected the broad scope of the workshop In both the prepared presentations and in the informal discussions the workshop

engaged exchanges across disciplines and invited a lively interaction between modelers and observers. The articles in this volume were invited and fully refereed. They provide a representative if necessarily incomplete account of the field of natural locomotion during a period of rapid growth and expansion. The papers presented at the workshop and the contributions to the present volume can be roughly divided into those pertaining to swimming on the scale of marine organisms swimming of microorganisms at low Reynolds numbers, animal flight and sliding and other related examples of locomotion.

Symmetric Functionals on Random Matrices and Random Matchings Problems Grzegorz Rempala, Jacek Wesolowski, 2007-12-06 This IMA Volume in Mathematics and its Applications SYMMETRIC FUNCTIONALS ON RANDOM MATRICES AND RANDOM MATCHINGS PROBLEMS During the academic year 2003-2004 the Institute for Mathematics and its Applications IMA held a thematic program on Probability and Statistics in Complex Systems. The program focused on large complex systems in which stochasticity plays a significant role. Such systems are very diverse and the IMA program emphasized systems as varied as the human genome, the internet and world financial markets. Although quite different, these systems have features in common such as multitudes of interconnecting parts and the availability of large amounts of high dimensional noisy data. The program emphasized the development and application of common mathematical and computational techniques to model and analyze such systems. About 1,000 mathematicians, statisticians, scientists and engineers participated in the IMA thematic program including about 50 who were in residence at the IMA during much or all of the year. The present volume was born during the 2003-2004 thematic program at the IMA. The two authors were visitors to the IMA during the program year with the first author resident for the entire ten months. This volume is a result of the authors' interactions at the IMA and especially their discussions with the many other program participants in the program and their involvement in the numerous tutorials, workshops and seminars held during the year.

Smart Device to Smart Device Communication Shahid Mumtaz, Jonathan Rodriguez, 2014-04-05 This book presents a comprehensive analysis of D2D communication over LTE-A band. The book uses 3GPP LTE-A as a baseline and explains all fundamental requirements for deploying D2D network under cellular systems from an architectural, technical and business point of view. The contributors explain the standardization activities of Release 12 of LTE-A which has been recently acknowledged as support of D2D communication in LTE-A. The text updates the research community on the D2D roadmap as well as new features emerging for consideration in 3GPP.

Wireless Network Design Jeff Kennington, Eli Olinick, Dinesh Rajan, 2010-11-10 This book surveys state-of-the-art optimization modeling for design, analysis and management of wireless networks such as cellular and wireless local area networks (LANs) and the services they deliver. The past two decades have seen a tremendous growth in the deployment and use of wireless networks. The current generation wireless systems can provide mobile users with high speed data services at rates substantially higher than those of the previous generation. As a result, the demand for mobile information services with high reliability, fast response times and ubiquitous connectivity continues to increase rapidly. The optimization of system performance has become critically

important both in terms of practical utility and commercial viability and presents a rich area for research In the editors previous work on traditional wired networks we have observed that designing low cost survivable telecommunication networks involves extremely complicated processes Commercial products available to help with this task typically have been based on simulation and or proprietary heuristics As demonstrated in this book however mathematical programming deserves a prominent place in the designer s toolkit Convenient modeling languages and powerful optimization solvers have greatly facilitated the implementation of mathematical programming theory into the practice of commercial network design These points are equally relevant and applicable in today s world of wireless network technology and design But there are new issues as well many wireless network design decisions such as routing and facility element location must be dealt with in innovative ways that are unique and distinct from wired fiber optic networks The book specifically treats the recent research and the use of modeling languages and network optimization techniques that are playing particularly important and distinctive roles in the wireless domain
