

The wireline cable can become key seated in a similar manner as a line string. Squeezing and minimum cable tension will reduce the risk of this.

3.1.7.1 Stripping Over Wireline Cable With Drillpipe to Recover Stuck Logging Tools

The following is an operational guide developed in Colombia and a description of the various tools used when stripping over logging cable. Notes of recommendations and lessons learned are included in the text.

3.1.7.1.1 Fishing Logging Tools

1. When the wireline company arrives on site for any logging job, check their fishing equipment. Check all crossovers are correct for the drill string in use. Correct overshot and grapple sizes are being used. Hang off 'T' bar and circulating sub with slotted hang off insert are all correct. Request for two hang off 'T' bars to be on site. 'C' plates to hang off the cable for the pipe size in use must be available, with extended handles to prevent floorhands trapping their fingers when using the 'C' plates. The wireline engineer should have an ample stock of cable and stops to make the cable into male and female fishing latches.

2. The wire line overshot (Fig 2) is made up of guide bowl, (various diameters available). Overshot bowl and top sub furnished with NC (PF) threads. It is advisable not to use too large a guide, (e.g., for an 8 1/2" hole use a 5" guide). After dressing the overshot with the correct sized and lightly tack welded. This is to prevent the line threads in the overshot assembly backing off whilst running in the hole. There is a no-go ring fixed in the top sub. The male fishing latch, attached to the logging cable in the hole, should not be able to pass through this no-go. If the cable breaks above the head or the female upper fishing latch fails, the drill string can be pulled out of the hole and the stuck cable recovered. The fishing head will be secured in the no-go ring. Check the male fishing latch does not pass through the ring; if it does, decrease the diameter of the no-go ring, which can be done by a welder. Check with the wireline engineer that the weak point assembly will pass through the no-go ring. If the weak point is broken at any time in order to recover the cable, the broken weak point assembly must be able to pass through the no-go ring. When the fish is inside the grapple assembly, circulation through the overshot is possible via two, approx. 3/4 inch diameter, holes at the top of the overshot bowl.

3. Hold a safety meeting with all concerned so that the wireline engineer can explain the operational procedures. Good communications between the winch operator and the wireline engineer on the rig floor are essential. Make sure there are four radios available (two for backup).
4. Double check the pipe tally and adjust the top of fish with respect to the logger's depth and the Driller's depth. Do not use HWDP unless no other drill pipe is available as the smaller ID of HWDP may restrict options at a later stage.

3.1.7.1.2 Procedure for Stripping Over Wireline Cable

- A. Install the pullers, one high in the derrick, below and to one side of the Crown. This should be positioned as not to interfere with the top-drive. On the top-drive motor surround, hook or travelling block, install a pulley to enable the logging cable to run up and down without snagging.
- B. Logging unit pulls approx. 1000 lb. tension on the cable in the hole. The cable 'T' clamp is installed. If there are two 'T' clamps, install both. The cable can slip so tighten up the screws carefully. Before installation check the brass inserts of the 'T' clamp are not worn; if they are, replace them.
- C. Logging unit slackens off the cable and lands out the 'T' bar on the rotary table. Cut the cable leaving plenty of slack to allow for the overshot length and for fitting a cable end stop. **Note: Advise all unnecessary personnel to stay clear of the loop left in this cable. If the cable slips injury to personnel can occur.**
