Kokhanovsky, 2010-08-05 Light scattering by densely packed inhomogeneous media is a particularly challenging optics problem In most cases only approximate methods are used for the calculations However in the case where only a small number of macroscopic scattering particles are in contact clusters or aggregates it is possible to obtain exact results solving Maxwell's equations Simulations are possible however only for a relatively small number of particles especially if their sizes are larger than the wavelength of incident light The first review chapter in Part I of this volume prepared by Yasuhiko Okada presents modern numerical techniques used for the simulation of optical characteristics of densely packed groups of spherical particles In this case Mie theory cannot provide accurate results because particles are located in the near field of each other and strongly interact As a matter of fact Maxwell's equations must be solved not for each particle separately but for the ensemble as a whole in this case The author describes techniques for the generation of shapes of aggregates The orientation averaging is performed by a numerical integration with respect to Euler angles The numerical aspects of various techniques such as the T matrix method discrete dipole approximation the finite difference time domain method effective medium theory and generalized multi particle Mie solution are presented Recent advances in numerical techniques such as the grouping and adding method and also numerical orientation averaging using a Monte Carlo method are discussed in great depth Radiation in the Atmosphere Wilford Zdunkowski, Thomas

Trautmann, Andreas Bott, 2007-03-29 This book presents the theory and applications of radiative transfer in the atmosphere. It is written for graduate students and researchers in the fields of meteorology and related sciences. The book begins with important basic definitions of the radiative transfer theory. It presents the hydrodynamic derivation of the radiative transfer equation and the principles of variance. The authors examine in detail various quasi-exact solutions of the radiative transfer equation and give a thorough treatment of the radiative perturbation theory. A rigorous treatment of Mie scattering is given, including Rayleigh scattering as a special case, and the important efficiency factors for extinction, scattering, and absorption are derived. The fundamentals of remote sensing applications of radiative transfer are presented. Problems of varying degrees of difficulty are included at the end of each chapter, allowing readers to further their understanding of the materials covered in the book.
