Power Integrity Modeling and Design for Semiconductors and Systems Madhavan Swaminathan, Ege Engin, 2007-11-19 The First Comprehensive Example-Rich Guide to Power Integrity Modeling. Professionals such as signal integrity engineers, package designers, and system architects need to thoroughly understand signal and power integrity issues in order to successfully design packages and boards for high-speed systems. Now for the first time, there's a complete guide to power integrity modeling, everything you need to know from the basics through the state-of-the-art. Using realistic case studies and downloadable software examples, two leading experts demonstrate today's best techniques for designing and modeling interconnects to efficiently distribute power and minimize noise. The authors carefully introduce the core concepts of power distribution design, systematically present and compare leading techniques for modeling noise, and link these techniques to specific applications. Their many examples range from the simplest using analytical equations to compute power supply noise through complex system-level applications. The authors introduce power delivery network components analysis, high-frequency measurement and modeling requirements, thoroughly explain modeling of power ground planes including plane behavior, lumped modeling, distributed circuit-based approaches, and much more. Offer in-depth coverage of simultaneous switching noise, including modeling for return currents using time and frequency domain analysis. Introduce several leading

time domain simulation methods such as macromodeling and discuss their advantages and disadvantages Present the application of the modeling methods on several advanced case studies that include high speed servers high speed differential signaling chip package analysis materials characterization embedded decoupling capacitors and electromagnetic bandgap structures This book s system level focus and practical examples will make it indispensable for every student and professional concerned with power integrity including electrical engineers system designers signal integrity engineers and materials scientists It will also be valuable to developers building software that helps to analyze high speed systems

Ali, 2004-05-19 We never create anything We discover and reproduce The Twelfth International Conference on Industrial and Engineering Applications of Artificial Intelligence and Expert Systems has a distinguished theme It is concerned with bridging the gap between the academic and the industrial worlds of Artificial Intelligence AI and Expert Systems The academic world is mainly concerned with discovering new algorithms approaches and methodologies however the industrial world is mainly driven by profits and concerned with producing new products or solving customers problems Ten years ago the artificial intelligence research gap between academia and industry was very broad Recently this gap has been narrowed by the emergence of new fields and new joint research strategies in academia Among the new fields which contributed to the academic industrial convergence are knowledge representation machine learning searching reasoning distributed AI neural networks data mining intelligent agents robotics pattern recognition vision applications of expert systems and others It is worth noting that the end results of research in these fields are usually products rather than empirical analyses and theoretical proofs Applications of such technologies have found great success in many domains including fraud detection internet service banking credit risk and assessment telecommunication etc Progress in these areas has encouraged the leading corporations to institute research funding programs for academic institutes Others have their own research laboratories some of which produce state of the art research

Kubota, Changhoo Chun, 2013-11-11 We are facing global issues concerning environmental pollution and shortages of food feed phytomass plant biomass and natural resources which will become more serious in the forthcoming decades To solve these issues immeasurable numbers of various plants and huge amounts of phytomass are required every year for food feed and for the improvement of amenities the environment and our quality of life Increased phytomass is also required as alternative raw material for producing bio energy biodegradable plastics and many other plant originated industrial products Only by using phytomass as a reproducible energy source and raw material instead of fossil fuels and atomic power we can save natural resources and minimize environmental pollution To increase phytomass globally we need billions of quality transplants small plants to be grown yearly in the field or in the greenhouse under various environmental conditions However these high quality transplants can be produced only under carefully controlled rather than variable environment al

conditions Recent research has shown that the closed transplant production system requires considerably small amounts of electricity water fertilizer CO and pesticide to produce value added transplants as scheduled with minimum release of environmental pollutants and minimum loss of transplants The closed or closed type transplant production system is defined as a transplant production system covered with opaque walls with minimized or controlled ventilation rates using artificial lighting With this system photoperiod light intensity and quality air temperature humidity CO concentration and air current speed can be controlled as desired
