effects of E10 and E 17 on legacy fuel system components from three common mid 1990s vintage vehicle models Ford GM
and Toyota were studied The fuel systems comprised a fuel sending unit with pump a fuel rail and integrated pressure
regulator and the fuel injectors The fuel system components were characterized and then installed and tested in sample
aging test rigs to simulate the exposure and operation of the fuel system components in an operating vehicle The fuel
injectors were cycled with varying pulse widths during pump operation Operational performance such as fuel flow and
pressure was monitored during the aging tests Both of the Toyota fuel pumps demonstrated some degradation in
performance during testing Six injectors were tested in each aging rig The Ford and GM injectors showed little change over
the aging tests Overall based on the results of both the fuel pump testing and the fuel injector testing no major failures were
observed that could be attributed to E17 exposure The unknown fuel component histories add a large uncertainty to the
aging tests Acquiring fuel system components from operational legacy vehicles would reduce the uncertainty **Toyota**
