How Organisms are Classified: Basics

- There are millions of species of organisms on Earth
- A species is defined as a group of organisms that can **reproduce to produce fertile offspring**
- These species can be classified into groups by the **features that they share** e.g. all mammals have bodies covered in hair, feed young from mammary glands and have external ears (pinnae)

The Binomial System

- Organisms were first classified by a Swedish naturalist called **Linnaeus** in a way that allows the subdivision of living organisms into smaller and more specialised groups
- The species in these groups have more and more features in common the more subdivided they get
- He named organisms in Latin using the **binomial system** where the scientific name of an organism is made up of two parts starting with the **genus** (always given a **capital letter**) and followed by the **species** (starting with a **lower case letter**)
- When typed binomial names are always in **italics** (which indicates they are Latin) e.g. *Homo sapiens*
- The sequence of classification is: **Kingdom, Phylum, Class, Order, Family, Genus, Species**
