

The Distribution and Characteristics of Water in Local and Global Environments

Introduction

Water is a critical resource for all living things, influencing ecosystems, human health, and the global climate. Understanding its distribution and characteristics is essential for managing this vital resource effectively. This report provides an overview of the distribution of water in Alberta, Canada, and the world, and discusses the significance of water supply and quality to human and ecological needs.

Distribution of Water

Global Distribution

Components of Earth's Water:

- **Oceans:** Approximately 97.5% of Earth's water is saltwater found in oceans.
- **Freshwater:** Only about 2.5% of Earth's water is freshwater.
 - **Glaciers and Ice Caps:** About 68.7% of freshwater is locked in glaciers and ice caps, primarily in Greenland and Antarctica.
 - **Groundwater:** Accounts for approximately 30.1% of freshwater.
 - **Surface Water:** Includes rivers, lakes, and reservoirs, making up about 1.0% of freshwater.

Availability of Potable Water:

- **Potable Water:** Only a small fraction of Earth's freshwater is accessible and safe for human consumption.
- **Graphical Interpretation:** Graphs often show a stark contrast between the vast amounts of water in oceans and the limited availability of drinkable water, highlighting the need for effective water management and conservation.

Water Distribution in Canada and Alberta

Canada:

- **Total Freshwater:** Canada holds about 20% of the world's freshwater resources.
