

WEATHERING AND EROSION STUDY GUIDE

1. What are the two types of weathering? Define both.

The two types of weathering are mechanical and chemical. Mechanical weathering is the process by which rocks are broken down physically. Chemical weathering is the process by which rocks break down chemically.

2. What are the agents of mechanical and chemical weathering?

The agents of mechanical weathering are water, wind, abrasion, and living things such as plants and animals. The agents of chemical agents are acid precipitation, acid in ground water, oxidation, and acids in living things such as bacteria, lichen, fungi, and algae. [Water, oxygen, carbon dioxide, and acids]

3. How does ice wedging (frost action) break down rock?

Water seeps into cracks of rock during warm weather, freezes and expands during cold weather, and continues the cycle.

4. Explain how lichens break down rock.

Lichens attach to rocks. Weak acids produced by the plant begin to weaken the rock. As the rock is exposed to the weak acid, the rock weathers over time.

5. How do acids in ground water cause caves to form?

Weak acids (carbonic or sulfuric acids) in groundwater react with rocks (limestone) in the ground causing a chemical reaction to occur. Over a long period of time, the dissolving of the rock forms karst features such as caverns.

6. What is oxidation? Where does oxidation occur?

Oxidation is a chemical reaction where an element such as iron is exposed to air causing an oxide to form, such as rust. Oxidation more often occurs in warm, moist climates when left exposed for long periods of time.

Marine Sediment Properties and

Embedment Anchors Douglas L. Jenkins, 1976 The principal objective of this presentation is to provide a relatively complete compilation of the results of work that has been done in the areas of soil mechanics and marine sediment research Only that data which could be more or less directly related to the design use and performance of explosive embedment anchors EEA s was used in this report The various physical properties of marine sediments are defined and described and their significance

to the performance of EEA s is discussed The problems involved in accurately predicting the depth of penetration and the required extraction pullout forces for EEA s in marine sediment are covered in detail Two methods for predicting penetration of EEA s in sediments are given The performance of the Army s XM 50 and XM 200 EEA s is reviewed and discussed briefly More study and research is required in order to obtain a better understanding of the geomechanical behavior of marine sediments

Geomorphology and the Carbon Cycle Martin Evans,2022-01-28 The first systematic examination of the role of geomorphological processes in the cycling of carbon through the terrestrial system Argues that knowledge of geomorphological processes is fundamental to understanding the ways in which carbon is stored and recycled in the terrestrial environment Integrates classical geomorphological theory with understanding of microbial processes controlling the decomposition of organic matter Develops an interdisciplinary research agenda for the analysis of the terrestrial carbon cycle Informed by work in ecology microbiology and biogeochemistry in order to analyse spatial and temporal patterns of terrestrial carbon cycling at the landscape scale Considers the ways in which as Humanity enters the Anthropocene the application of this science has the potential to manage the terrestrial carbon cycle to limit increases in atmospheric carbon
