Peptide Therapeutics Ved Srivastava, 2019-08-16 Peptide therapy has become a key strategy in innovative drug development however one of the potential barriers for the development of novel peptide drugs in the clinic is their deficiencies in clearly defined chemistry manufacturing and controls CMC strategy from clinical development to commercialization CMC can often become a rate limiting step due to lack of knowledge and lack of a formal policy or guidelines on CMC for peptide based drugs Regulators use a risk based approach reviewing applications on a case by case basis *Peptide Therapeutics Strategy and Tactics for Chemistry Manufacturing and Controls* covers efficient manufacturing of peptide drug substances a review of the process for submitting applications to the regulatory authority for drug approval a holistic approach for quality attributes and quality control from a regulatory perspective emerging analytical tools for the characterisation of impurities and the assessment of stability This book is an essential reference work for students and researchers in both academia and industry with an interest in learning about CMC and facilitating development and manufacture of peptide based drugs

OECD Guidelines for the Testing of Chemicals, Section 4 Test No. 470: Mammalian Erythrocyte Pig-a Gene Mutation Assay OECD, 2025-06-25 This Test Guideline describes an in vivo erythrocyte Pig a gene mutation assay hereafter called the Pig a assay which uses an endogenous mammalian gene the phosphatidylinositol glycan class A gene Pig a as a reporter of somatic cell gene mutation In vivo gene mutation tests such as the Pig a assay are especially relevant for assessing mutagenicity because physiological factors such as absorption of the test chemical from the site of exposure distribution of the test chemical throughout the test system via systemic circulation and in vivo metabolism and DNA repair processes all contribute to the mutagenic responses

New Directions in the Modeling of Organometallic Reactions Agustí Lledós, Gregori Ujaque, 2020-11-05 This book focuses on the computational modeling of organometallic reactivity In recent years computational methods particularly those based on Density Functional Theory DFT have been fully incorporated into the toolbox of organometallic chemists methods Nowadays energy profiles of multistep processes are routinely calculated and detailed mechanistic pictures of the reactions arise from these calculations This type of analysis is increasingly performed even by experimentalists themselves The volume aims to connect established computational organometallics with the more recent theoretical and methodological developments applied to this field This

would allow broadening of the simulation scope toward emergent organometallic areas as ligand design or photoactivated processes to narrow the gap between calculations and experiments microkinetic models and even to discover new reactions automated methods Given the broad interest and extensive application that computational methods have reached within the organometallic community this new volume will attract the interest of both experimental and computational organometallic chemists
