

1. Write the definition of evolution. Give an example.

Evolution is the change in a population over a gradual period of time. Examples: the peppered moths changed colors as their environment changed color.

2. Why does evolution occur? Explain using: natural selection, variation, and random mutations.

Random mutations occur in populations all of the time. Mutations that produce variations (ie white fur instead of brown) sometimes help an organism ADAPT to its environment BETTER. Organisms that are better adapted are more likely to live and produce offspring. Eventually, this trait can take over a population.

3. How does studying embryos give us clues to which organisms are most closely related? Give an example.

Embryos that have the most similarities throughout gestation are most likely more closely related. For example, the rabbit and the human are almost identical up until the third trimester.

4. What is the difference between artificial and natural selection. Give examples of each.

Artificial is driven by humans while natural selection is driven by nature. Dogs are an example of artificial selection while wolves are an example of natural selection.

5. Describe the bunny lab. What made the bunny population grow? Disappear? Change?

In the bunny lab, you could add mutations that enabled the bunnies to better adapt to their environments (ie food sources, habitat, predators). A favorable trait quickly replaced the less favorable one.

6. Below is a phylogeny (tree of common ancestors):

- How are common ancestors indicated? **Intersecting lines.**
- Which organisms are most closely related? **Bear/Chimp**
- Which organisms are least related? **Lamprey/Chimp**
- Which organism is most closely related to a Lamprey? **Sunfish**

7. What is the definition of a species?

A population of animals that can interbreed and produce fertile offspring.

8. Are ligers, zorses, and mules considered their species? Why or why not?

No. They can mate but their offspring are sterile. You cannot breed two ligers and make more ligers.

9. Define "niche" and "competition". Give examples of each.

A "niche" is the role or function of an organism in its environment. "Competition" is a negative interaction between organisms where they are competing for the same limited resource (ie food or shelter). Examples: a predator's "niche" is often to control prey populations. "Competition" occurs between tigers who roamate and hunt in overlapping territories.

Cultural Evolution Alex Mesoudi, 2011-07-30 Charles Darwin changed the course of scientific thinking by showing how evolution accounts for the stunning diversity and biological complexity of life on earth. Recently there has also been increased interest in the social sciences in how Darwinian theory can explain human culture. Covering a wide range of topics including fads, public policy, the spread of religion, and herd behavior in markets, Alex Mesoudi shows that human culture is itself an evolutionary process that exhibits the key Darwinian mechanisms of variation, competition, and inheritance. This cross-disciplinary volume focuses on the ways cultural phenomena can be studied scientifically, from theoretical modeling to lab experiments, archaeological fieldwork to ethnographic studies, and shows how apparently disparate methods can complement one another to the mutual benefit of the various social science disciplines. Along the way, the book reveals how new insights arise from looking at culture from an evolutionary angle. *Cultural Evolution* provides a thought-provoking argument that Darwinian evolutionary theory can both unify different branches of inquiry and enhance understanding of human behavior.

Evolutionary Psychology David M. Buss, 2024-08-06 Where did we come from? What is our connection with other life forms? What are the mechanisms of mind that define what it means to be a human being? In the seventh edition of this revolutionary textbook, David M. Buss examines human behavior from an evolutionary perspective, providing students with the conceptual tools needed to study evolutionary psychology and apply them to empirical research on the human mind. Content is organized by topic, beginning with the challenges of survival, mating, parenting, and kinship, progressing to challenges of group living, including cooperation, aggression, sexual conflict, and status, prestige, and social hierarchies. Key features of this edition include updated and enhanced material based on an explosion of new theories and research, including dozens of new references; expanded coverage of topics including socioecology, behavior, emotions, and gender; exploration of evolutionary mismatches in several domains, such as survival, kinship, and mating, including a discussion of internet dating. With a wealth of student-friendly pedagogy, including critical thinking questions and case study boxes supporting the application of evolutionary psychology to real-world situations, this is an invaluable resource for undergraduates studying psychology, biology, and anthropology. The textbook is also supported by a range of instructor resources, including PowerPoint slides, a test bank, and an instructor's manual to help students achieve their higher learning goals.

The Perception of the Environment Tim Ingold,2021-11-29 In this work Tim Ingold offers a persuasive new approach to understanding how human beings perceive their surroundings He argues that what we are used to calling cultural variation consists in the first place of variations in skill Neither innate nor acquired skills are grown incorporated into the human organism through practice and training in an environment They are thus as much biological as cultural To account for the generation of skills we have therefore to understand the dynamics of development And this in turn calls for an ecological approach that situates practitioners in the context of an active engagement with the constituents of their surroundings The twenty three essays comprising this book focus in turn on the procurement of livelihood on what it means to dwell and on the nature of skill weaving together approaches from social anthropology ecological psychology developmental biology and phenomenology in a way that has never been attempted before The book is set to revolutionise the way we think about what is biological and cultural in humans about evolution and history and indeed about what it means for human beings at once organisms and persons to inhabit an environment The Perception of the Environment will be essential reading not only for anthropologists but also for biologists psychologists archaeologists geographers and philosophers This edition includes a new Preface by the author **BSCS Science Technology : Investigating Earth Systems, Teacher Edition** ,2005
