Computable Foundations for Economics K. Vela Velupillai, 2012-07-26 Computable Foundations for Economics is a unified collection of essays some of which are published here for the first time and all of which have been updated for this book on an approach to economic theory from the point of view of algorithmic mathematics By algorithmic mathematics the author means computability theory and constructive mathematics This is in contrast to orthodox mathematical economics and game theory which are formalised with the mathematics of real analysis underpinned by what is called the ZFC formalism i.e. set theory with the axiom of choice This reliance on ordinary real analysis and the ZFC system makes economic theory in its current mathematical mode completely non algorithmic which means it is numerically meaningless The book provides a systematic attempt to dissect and expose the non algorithmic content of orthodox mathematical economics and game theory and suggests a reformalization on the basis of a strictly rigorous algorithmic mathematics This removes the current schizophrenia in mathematical economics and game theory where theory is entirely divorced from algorithmic applicability for experimental and computational exercises The chapters demonstrate the uncomputability and non constructivity of core areas of general equilibrium theory game theory and recursive macroeconomics The book also provides a fresh look at the

kind of behavioural economics that lies behind Herbert Simon's work and resurrects a role for the noble classical traditions of induction and verification viewed and formalised now algorithmically It will therefore be of particular interest to postgraduate students and researchers in algorithmic economics game theory and classical behavioural economics

Applied Functional Analysis J. Tinsley Oden, Leszek Demkowicz, 2010-03-02 Through numerous illustrative examples and comments Applied Functional Analysis Second Edition demonstrates the rigor of logic and systematic mathematical thinking It presents the mathematical foundations that lead to classical results in functional analysis More specifically the text prepares students to learn the variational theory of partial differential equations distributions and Sobolev spaces and numerical analysis with an emphasis on finite element methods While retaining the structure of its best selling predecessor this second edition includes revisions of many original examples along with new examples that often reflect the authors own vast research experiences and perspectives This edition also provides many more exercises as well as a solutions manual for qualifying instructors Each chapter begins with an extensive introduction and concludes with a summary and historical comments that frequently refer to other sources New to the Second Edition Completely revised section on $\limsup$ and $\liminf$ New discussions of connected sets probability Bayesian statistical inference and the generalized integral Minkowski inequality New sections on elements of multilinear algebra and determinants the singular value decomposition theorem the Cauchy principal value and Hadamard finite part integrals New example of a Lebesgue non measurable set Ideal for a two semester course this proven textbook teaches students how to prove theorems and prepares them for further study of more advanced mathematical topics It helps them succeed in formulating research questions in a mathematically rigorous way
