School of Civil Engineering,1997 Multilevel Solution Procedures for Structural Dynamics Eigenvalue Problems Tsanhuei Hwang,1991
Three multigrid algorithms are described that can solve the symmetric generalized eigenvalue problem encountered in structural dynamics First the multigrid algorithm for solving linear matrix equations is incorporated into the subspace iteration and block Lanczos methods to produce implicit subspace and Lanczos multigrid methods The nested iteration technique is adopted to produce the initial trial vectors Second the basic multigrid idea of fine mesh relaxation followed by a coarse mesh correction is explicitly applied to the eigenvalue problem to produce an explicit multigrid method The nested iteration technique is also used to provide information on the coarse meshes and to produce good initial approximations to the fine mesh eigensolutions Particular attention is paid to the implementation of these methods on vector and shared memory parallel supercomputers Several large scale problems are used to study the convergence behavior and computational performance of the methods The vector and parallel performance of the algorithms are tested using an Alliant FX 80 a Convex C240 and a Cray Y MP8 832 For example the first eigensolution of a plate problem with 3 151 875 degrees of freedom is solved in 670 seconds with 370 Mbytes of in core storage on the Convex In addition a computation rate of 950 Mflops and a speedup of 6 5 96 7% of parallelism are measured on the Cray *Solutions Manual to Accompany Structural Analysis* Jack C.
