

Auditing and Internal Control

LEARNING OBJECTIVES

After studying this chapter, you should:

- Know the difference between attest services and advisory services and be able to explain the relationship between the two.
- Understand the structure of an audit and have a firm grasp of the conceptual elements of the audit process.
- Understand internal control categories presented in the COSO framework.
- Be familiar with the key features of Section 302 and 404 of the Sarbanes-Oxley Act.
- Understand the relationship between general controls, application controls, and financial data integrity.

Recent developments in **information technology (IT)** have had a tremendous impact on the field of **auditing**. IT has inspired the reengineering of traditional business processes to promote more efficient operations and to improve communications within the entity and between the entity and its customers and suppliers. These advances, however, have introduced new risks that require unique internal controls. They have engendered the need for new techniques for evaluating controls and for assuring the security and accuracy of corporate data and the information systems that produce it.

This chapter provides an overview of IT auditing. We begin by describing the various types of audits that organizations commission and distinguish between the auditor's traditional attestation responsibility and the emerging field of advisory services. We go on to explain the structure of an IT audit: the relationship between management assertions, audit objectives, tests of controls, and substantive tests are explained. The chapter also outlines the key points of the COSO control framework, which defines internal controls in both manual and IT environments. The final section of the chapter examines audit issues and implications related to Sarbanes-Oxley legislation and provides a conceptual framework that links general controls, application controls, and financial data integrity. This framework is a model for the remainder of the text.

Chuck Ballard,John Baldwin,Alex Baryudin,Gary Brunell,Christopher Giardina,Marc Haber,Erik A O'Neill,Sandeep Shah,IBM Redbooks,2014-04-04 Managing information within the enterprise has always been a vital and important task to support the day to day business operations and to enable analysis of that data for decision making to better manage and grow the business for improved profitability To do all that clearly the data must be accurate and organized so it is accessible and understandable to all who need it That task has grown in importance as the volume of enterprise data has been growing significantly analyst estimates of 40 50% growth per year are not uncommon over the years However most of that data has

been what we call structured data which is the type that can fit neatly into rows and columns and be more easily analyzed. Now we are in the era of big data. This significantly increases the volume of data available but it is in a form called unstructured data. That is data from sources that are not as easily organized such as data from emails, spreadsheets, sensors, video, audio, and social media sites. There is valuable information in all that data but it calls for new processes to enable it to be analyzed. All this has brought with it a renewed and critical need to manage and organize that data with clarity of meaning, understandability, and interoperability. That is you must be able to integrate this data when it is from within an enterprise but also importantly when it is from many different external sources. What is described here has been and is being done to varying extents. It is called information governance. Governing this information however has proven to be challenging. But without governance much of the data can be less useful and perhaps even used incorrectly significantly impacting enterprise decision making. So we must also respect the needs for information security, consistency, and validity or else suffer the potential economic and legal consequences. Implementing sound governance practices needs to be an integral part of the information control in our organizations. This IBM Redbooks publication focuses on the building blocks of a solid governance program. It examines some familiar governance initiative scenarios identifying how they underpin key governance initiatives such as Master Data Management, Quality Management, Security, and Privacy, and Information Lifecycle Management. IBM Information Management and Governance solutions provide a comprehensive suite to help organizations better understand and build their governance solutions. The book also identifies new and innovative approaches that are developed by IBM practice leaders that can help as you implement the foundation capabilities in your organizations.
