12. In a chemical change, one or more substances are converted into different substances. A physical change does not involve a change in the identity of the substance or substances present.
13. metals: shiny; good conductors of heat; good conductors of electricity; malleable or ductile; most are solids at room temperature
nonmetals: poor conductors of heat; poor conductors of electricity; many are gases at room temperature; those that are solids are brittle rather than malleable or ductile metalloids: properties intermediate between those of metals and nonmetals; less malleable than metals but not as brittle as solid nonmetals; most are semiconductors of electricity

12. All cathode rays are the same, regardless of their source. Therefore, the particles responsible for the cathode rays must be present in all atoms. The particles are electrons.
13. When the average atomic mass is calculated, it is 10.811. Because the atomic mass is the same as the atomic mass of boron, mythium was not a new element.

One control row should be planted under the same control factors but with no fertilizer. There are at least four things that could be used to determine the results: size, quantity, appearance, and taste. Analysis might include bar graphs of each of these measurements for each of the five fertilizer types and the no-fertilizer control row.

12. Electrons in atoms can occupy orbitals of only specific energies. When an atom is excited, the electron is no longer in the ground state. When the electron returns to a lower energy level, light is emitted. Because only specific energies are allowed, certain wavelengths of light are emitted, giving rise to the individual lines in the spectrum.
13. Photons of blue light are higher energy than photons of yellow light. Electrons can be emitted only when a photon of sufficient energy strikes the surface of the metal. Therefore, the energy of blue light is greater than the threshold energy, but the energy of yellow light is not.

10. Hybridization explains how the orbitals of an atom become rearranged when the atom forms covalent bonds.
11. Ionic crystals are brittle because shifting of the layers of ions results in large repulsive forces that cause the layers to part completely.
12. Naphthalene has the stronger intermolecular forces even though it is non-polar, because its boiling point is higher than that of acetic acid. Boiling point is directly correlated to strength of intermolecular forces; the stronger the intermolecular forces, the more energy needed to break all the intermolecular forces, and therefore the higher the boiling point. Naphthalene is so large that its dispersion forces are greater than the sum of the dispersion forces and hydrogen bonding in acetic acid.
13. There is a repulsive region at small bond distances, a minimum well at an intermediate bond distance, and an asymptotic region at large bond distances. The repulsive region is due to the repulsion between the two positive nuclei at distances where the nuclei are close to each other. The asymptotic region is where the atoms are far apart and therefore do not interact with each other. The potential energy decreases as the atoms come closer together and are attracted to each other. The minimum well is the region where the attractive forces are balanced by the repulsive forces. This distance is the equilibrium bond length.

Standardized Test Practice McGraw-Hill/Glencoe, 2007-05 **Crushing ICE** Blaine E. Hatt, 2022-12-08 21st-century educators face a new frontier beyond the boundaries of traditional teaching practice and pedagogical praxis. Imagination Creativity Education ICE creates fresh opportunities for teachers who are committed to genuine empowering experiential learning. In *Crushing ICE*, Short on Theoretical, Long on Practical Approaches to Imagination Creativity Education, teachers will discover how to take risks and transition with confidence from conventional to imaginative and creative approaches, promote collaborative learning, enrich the efficacy, esteem, and identity of learners, implement learning-centred strategies, activities, and practices informed by diverse theoretical perspectives, advance meaningful inquiry, and relational learning that engages learners at a deep level. Every day, teachers confronted with student exceptionalities, multi-age groupings, overemphasis on provincial standardized testing, and intransigent administrative practices and directives struggle to promote curiosity, imagination, creativity, innovation, creative process, and risk-taking in their classrooms. ICE teaches a practical alternative approach that recognizes the importance of these constructs within the self as teacher, the other as learner, and all together in a community of learnership. An exposition of ICE, *Crushing ICE* shows educators how to challenge the status quo en route to fostering innovative learning in regular courses, visual arts, performing arts, and educational transitions. This book is an instructional resource text focused on pre-service and in-service teachers for creativity-based education. *Crushing ICE* is a unique compilation of scholarly yet practical writings by nationally and internationally recognized teachers and teacher educators who present a predominantly pan-Canadian perspective.
