

Dual Cab Control

Wiring a DC Layout for Dual Cab Control with Atlas Controllers & Selectors

To achieve dual-cab control, your layout must first be split into electrically isolated sections, or power blocks. This is done by adding plastic insulated rail joints at set intervals along the control rail of your layout. These insulated rail joints thus define the start and end of each independent power block. In this example, the layout has been divided into 8 power blocks. There is no need to isolate the common (-) rail from section to section.

Dual cab control allows you to run two locomotives independently of one another, each being controlled by a separate power controller, or cab. This method only applies to DC layouts, as DCC layout use digital signals to independently control the locomotives.

In the example to the left, locomotive B is shown operating on power blocks 4, 5, and 6, all of which are controlled and powered by power pack B. Locomotive A is on a section of track powered by power pack A, which controls power blocks 1, 2, 3, 7, 8, and 8. As the locomotives move forward, the next upcoming power block will need to be manually switched on the Atlas selector to the correct power pack (cab) which is currently powering that locomotive. In this example, locomotive B will soon occupy power block 7, then 8, and so on, so these blocks will need to be changed on the Atlas selector to from cab A to cab B. Power block 4, 5, and 6 will eventually need to be changed on the Atlas selector from cab B to A as locomotive A moves into those power blocks.

Use two power packs (cabs) for dual cab control. Some manufacturers offer 2 independent power packs in a single housing. These power packs are connected to the 'CAB A' and 'CAB B' terminals on the Atlas controller. Note that the DC wires on power pack B are reversed when connecting to the Atlas controller. This is due to the Atlas controller's design and will ensure that the polarity will be the same for both CAB A and CAB B when the reversing switches are both set in either the forward or reverse position.

Connect the common rail of all power blocks to the 'C' terminal on the Atlas controller. It is not required to isolate the common rail from neighboring power blocks.

Since the layout is split into electrically isolated sections, each section now needs to be independently powered. The power wire to each section is attached to the control rail (the isolated side), and to the corresponding screw terminal on the Atlas selector. This will now allow the power to each power block to be managed and controlled by the Atlas selector.

The Atlas selector allows you to toggle between two separate power packs which can control any single section of track attached to the selector. Each selector can control 4 independent sections of track (power blocks). When the selector's switch is moved up to position 'N', it will send power from power pack A to the attached section of track. When the selector's switch is moved down to position 'R', it will then send power from power pack B to that attached section of track. Additional selectors can be added as required.

The Atlas controller serves a couple important functions, such as directional control of the locomotives, R/F or F/R control for turntables and reversing loops, as well as a connection point for the Atlas selectors. The controller also has a terminal that connects to the layout's common rail. See the 'Dual Cab Control - Turntable' wiring diagram for more details on the Atlas controller.
