## Exercises - 4

1. Figure 4.12 is a simplified process model of you, in which there are only two states: sleeping and waking. You make the transition from waking to sleeping when you are tired, and from sleeping to waking when the alarm clock goes off.

There can be many answers, look for originality here. One solution is shown below.

2. Describe context switching in lay terms and identify the process information that needs to be saved, changed, or updated when context switching takes place?

Context switching is the passing of sufficient information to allow one page to be interrupted so another page can be moved into memory for processing. Essentially, during a context switch, the critical processing information for the page about to be replaced is saved in its Process Control Block, so that later, when it's allowed to continue, it can pick up where it left off. The saved information includes the process identification, its status, and its state (which includes the process status work, register contents, main memory resources, other allocated resources, and process priority).
