

Experiment No. 5 EGG FOAM STABILITY

Objectives: To identify the effect of sugar on the stability of the egg white foam.
To identify the effect of sugar on the beating time of the egg white foam.

To identify the factors that affect egg foam stability.

Data:

Table 1. Height and time for beating of egg foam

Variation	Height (mm)	Beating Time
A	25	9 minutes 6 seconds
B	18	6 minutes 49 seconds
C	15	6 minutes 6 seconds
D	17	7 minutes 23 seconds

Interpretation, Analysis, and Discussion:

As shown in Table 1, Variation A has the highest height, followed by Variation B, then Variation D, and finally, Variation C. Also shown in the table, Variation A has the longest beating time, it is then followed by Variation D, then Variation B, and then Variation C.

Egg whites are made up of water, proteins, and small amounts of minerals and sugars. When egg whites are beaten, foam is produced. Air is added and the egg white protein, albumen, is denatured. Denaturation is the change of a protein's shape under stress, in this case, beating. This exposes the hydrophobic and hydrophilic ends of the protein. The proteins align themselves between air and water forming bubbles with their hydrophilic chains pointing into the water and dangling their hydrophobic chains in the air. In addition the proteins can bond to one another side-to-side as crosslinks which add to the stability of the foam. The denatured protein coats the air bubbles and holds in the water, causing them to become stiff and stable (BoVšková and Míková, 2010).

There are factors that can affect the stability of foams. One is sugar. In the experiment, Variation A, B, C, and D were made by adding sugar before beating, adding sugar when egg white is foamy, adding sugar when soft peaks form the foam, and adding sugar when stiff peaks form in the foam, respectively. The addition of sugar increases the smoothness and stability of the foam, for less drainage occurs when the egg is beaten to a definite stiffness (Lowe, 2009). This stability is due to the hygroscopic nature of sugar which holds the water that might escape from the foam.

Although sugar adds to the stability of foams, it also retards denaturation and therefore coagulation. Considerably more beating is required to reach the proper stage, and this increased beating results in a foam of finer texture. If the sugar is added before the beating is completed (Variation A), a longer time is required to beat the egg white. That's because the sugar molecules get in the way of the egg proteins. With sugar molecules in the way, it takes longer for the proteins to find each other and form bonds (Gardiner and Wilson, 2012). Because of this, sugar should be added to the egg white as soon as the beating is started and egg white is
