### Problem 1.1

A nucleus, originally at rest, decays radioactively by emitting an electron of momentum  $1.73 \text{ MeV}/c$ , and at right angles to the direction of the electron a neutrino with momentum  $1.00 \text{ MeV}/c$ . (The  $\text{MeV}$  (million electron volt) is a unit of energy, used in modern physics, equal to  $1.60 \times 10^{-6} \text{ erg}$ . Correspondingly,  $\text{MeV}/c$  is a unit of linear momentum equal to  $5.34 \times 10^{-17} \text{ gm-cm/sec.}$ ) In what direction does the nucleus recoil? What is its momentum in  $\text{MeV}/c$ ? If the mass of the residual nucleus is  $3.90 \times 10^{-27} \text{ gm}$ , what is its kinetic energy, in electron volts?

Place the nucleus at the origin, and suppose the electron is emitted in the positive  $y$  direction, and the neutrino in the positive  $x$  direction. Then the resultant of the electron and neutrino momenta has magnitude

$$|\mathbf{p}_{\text{recoil}}| = \sqrt{(1.73)^2 + 1^2} = 2 \text{ MeV}/c,$$

and its direction makes an angle

$$\theta = \tan^{-1} \frac{1.73}{1} = 60^\circ$$

with the  $x$  axis. The nucleus must acquire a momentum of equal magnitude and directed in the opposite direction. The kinetic energy of the nucleus is

$$T = \frac{p^2}{2m} = \frac{4 \text{ MeV}^2 c^{-2}}{2 \cdot 3.9 \cdot 10^{-27} \text{ gm}} \cdot \frac{1.78 \cdot 10^{-27} \text{ gm}}{1 \text{ MeV } c^{-2}} = 9.1 \text{ eV}$$

This is much smaller than the nucleus rest energy of several hundred  $\text{GeV}$ , so the non-relativistic approximation is justified.

**Fractals in Rock Mechanics** Heping Xie, 1993-01-01 Important developments in the progress of the theory of rock mechanics during recent years are based on fractals and damage mechanics The concept of fractals has proved to be a useful way of describing the statistics of naturally occurring geometrics Natural objects from mountains and coastlines to clouds and forests are found to have boundaries best described as fractals Fluid flow through jointed rock masses and clusterings of earthquakes are found to follow fractal patterns in time and space Fracturing in rocks at all scales from the microscale microcracks to the continental scale megafaults can lead to fractal structures The process of diagenesis and pore geometry of sedimentary rock can be quantitatively described by fractals etc The book is mainly concerned with these developments as related to fractal descriptions of fragmentations damage and fracture of rocks rock burst joint roughness rock porosity and permeability rock grain growth rock and soil particles shear slips fluid flow through jointed rocks faults earthquake clustering and so on The prime concerns of the book are to give a simple account of the basic

concepts methods of fractal geometry and their applications to rock mechanics geology and seismology and also to discuss damage mechanics of rocks and its application to mining engineering The book can be used as a textbook for graduate students by university teachers to prepare courses and seminars and by active scientists who want to become familiar with a fascinating new field     Introducing Special Relativity W.S.C. Williams,2002-05-02 Introducing Special Relativity provides an easy and rewarding way into special relativity for first and second year university students studying physics The author establishes the fundamentals of relativity at the outset of this book so readers fully understand the principles and know how to them before moving on to subjects like time dilation that often are a source of difficulty for students The primary topics addressed include conserved relativistic energy and momentum applications of the Lorentz transformation and developments in 20th century physics This volume also reviews some of the early experiments in the development of special relativity
