

Prelab Information

Purpose	Explore the molecular process of building proteins from the information carried by RNA using a laboratory procedure.
Time	Approximately 45 minutes
Question	How are proteins built using the information provided by a molecule of RNA?
Prediction	RNA determines the sequence of amino acids in proteins and polypeptides by a two-step process: transcription of DNA produces mRNA in the nucleus, then translation of the mRNA to tRNA takes place at the ribosome in the cytoplasm.

Lab Procedure

Materials:

- helicase
- human cell
- tRNA sequence
- protein structure chart

Step 1: Transcribe the Information in DNA to mRNA

(The animation will zoom from the human cell to the nucleus to the DNA strand.)

- Find and click the arrow that represents the direction in which the mRNA is built. Like DNA, mRNA is always built from the 5' direction to the 3'.
- Which RNA nucleotide can pair with the thymine (T) at the beginning of the strand? Drag it into the DNA antisense strand to make a pair.
- Complete nine (9) additional base pairs. Remember, there is no thymine (T) in RNA. The adenine (A) in the DNA needs to pair with uracil (U).
- After your mRNA sequence record is complete, click "Leave the Nucleus" to send the mRNA to the ribosome in the cell's cytoplasm, where production of proteins will take place.

Step 2: Locate Codons

(You will continue to read mRNA from the 5' end toward the 3' end.)

- A codon is a sequence of three bases that indicates a unit of information in the RNA. A gene is a series of codons that results in the production of a protein. Identify the codons of the mRNA shown. The start codon for a gene is AUG, so start by dragging the blue start codon box over the AUG on the strand. (The start codon is already recorded on the data table.)
- Use the gray codon box to highlight additional codons three bases at a time. When you reach a stop codon (either UAA, UAG, or UGA) you will need to use the pink stop codon box. As you form codons, record them in Table 1.

Step 3: Translate mRNA

tRNA is composed of short sections of RNA that bond to the codons in mRNA. The screen shows a pool of tRNA anticodons, which carry the amino acids to the ribosome and attach to the mRNA when its sequence of base pairs is complementary with the mRNA in the ribosome.

- For each codon, you will find the correct tRNA anticodon and drag it to the ribosome. Start with the AUG codon in the ribosome. Find and drag its match, the UAC anticodon, to it. Record this
